#### Abstract

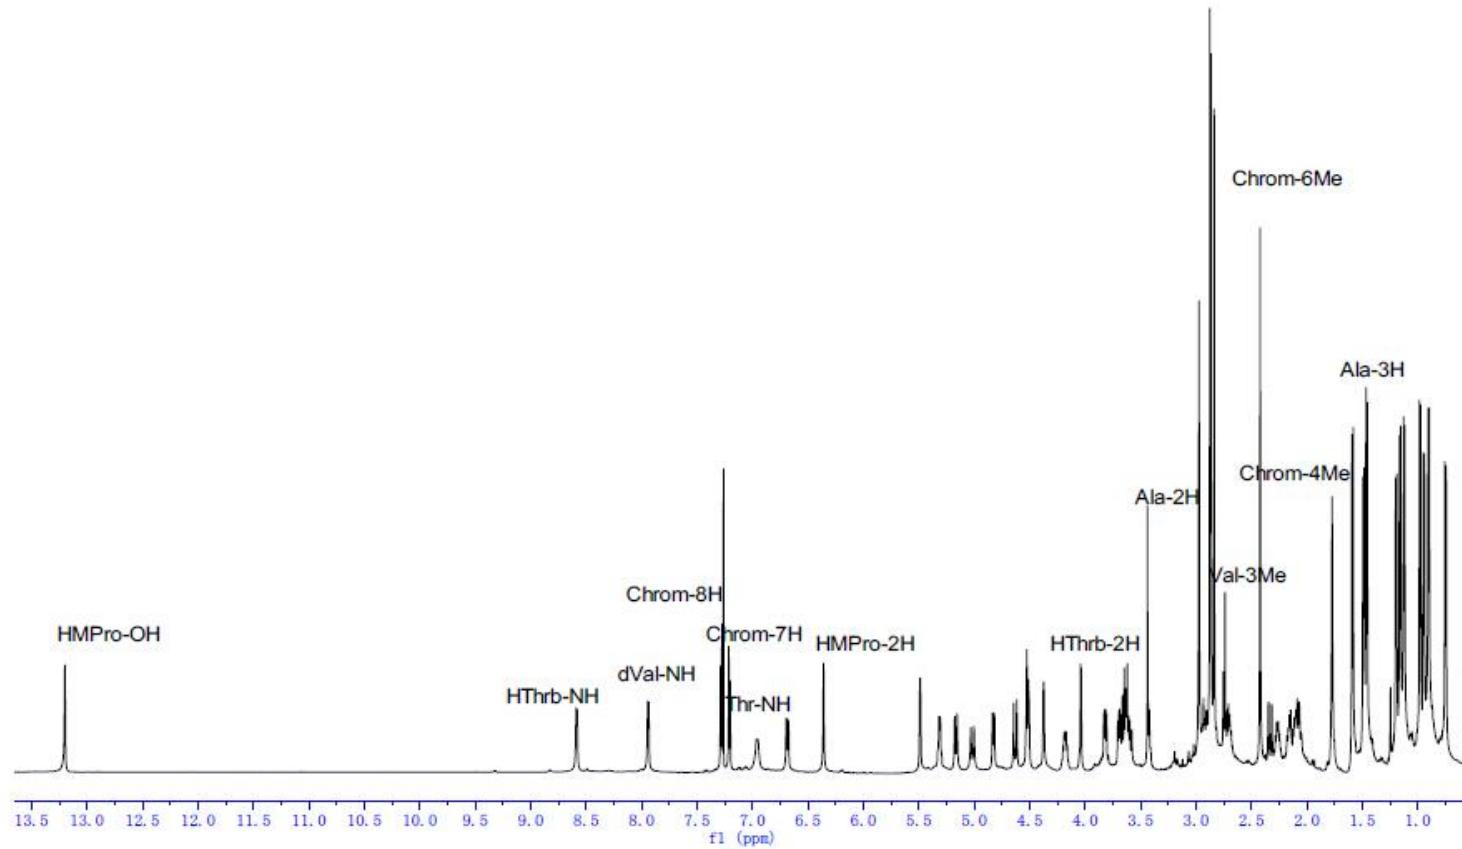

Actinomycin Z<sub>6</sub> (**1**), a new member of the actinomycin family, along with three congeners of the Z-type (Z<sub>1</sub>, Z<sub>3</sub>, Z<sub>5</sub>) actinomycins, are produced from *Streptomyces* sp. KIB-H714. Their structures were authenticated by comprehensive spectroscopic data interpretation. Different from all the reported Z-type actinomycins, the  $\beta$ -ring of the new compound actinomycin Z<sub>6</sub> includes an additional ring linked between the actinoyl chromophore and  $\beta$ -peptidolactone. In Z<sub>3</sub> and Z<sub>5</sub>, the L-threonine in  $\beta$ -depsipeptide is replaced by the unusual 4-chlorothreonine, an amino acid rarely found in actinomycin family. All isolates were evaluated for cytotoxicity against five human tumor cell lines and for inhibitory activity against *Candida albicans* and *Staphylococcus aureus*.

**Keywords:** actinomycin; *Streptomyces*; cytotoxicity; antibacterial activity; structure elucidation
