Abstract

ES contains compounds known to have significant anti-fatigue activity. In recent years, it has received extensive attention because it's efficient. However, its active ingredients on antifatigue are still unclear. This study attempts to establish the spectrum-effect relationship of *ES* antifatigue to screen the effective components. The results showed that the similarity of 15 *ES* fingerprints obtained by LC-MS/MS was 0.533~0.992, and the chemical structures of 22 common peaks were identified. The anti-fatigue activity of 15 batches of *ES* was characterized by forced swimming test of mice and quantified by CAFI, among which S4, S1 and S5 had better activity. 9 components (caffeic acid, 5-(4-O- β -D-glucosylferoyl)-quinic acid, (+/-)13-HODE, isofraxidin, eleutheroside E, syringin, pinoresinol diglucoside or its isomer, 7,8-dihydrodehydrocarbinol alcohol-4-O- β -D-glucoside, secoisolariciresinol-4-O- β -D-glucoside) highly related to anti-fatigue activity may be the effective components of *ES*.

Keywords: *Eleutherococcus senticosus*; spectrum-effect relationship; anti-fatigue; factor analysis; forced swimming test of mice; LC-MS/MS

Table S1 Similarity calculation results of HPLC fingerprint of *ES*

No.	Similarity	No.	Similarity	No.	Similarity
S1	1	S6	0.533	S11	0.835
S2	0.918	S7	0.981	S12	0.980
S3	0.992	S8	0.655	S13	0.992
S4	0.977	S9	0.923	S14	0.951
S5	0.584	S10	0.984	S15	0.990

Note: S1 was taken as the reference chromatogram
