## Simulation of the incomplete data

The data in Tables S1, S2 and S3 correspond to a simulation study to evaluate the performance of the procedure proposed in the manuscript entitled “Selection of terms in random coefficient regression models” in situations with missing observations.

We set  $\sigma^2 = 1$  and  $\rho = 0.4, 0.6$  and  $0.8$  and considered 80 different settings based on combinations of different values for  $n$  (5, 10, 25, 50 and 100),  $\sigma_a^2$  (0.5, 1, 2 and 4),  $\sigma_b^2$  (0.5, 1 and 2) and  $\rho_{ab}$  (0.25, 0.75). We assumed that each unit had a 50% probability of missing one observation; the position of the missing observation was chosen at random among the five available. For each setting we simulated 1000 samples and in each case we fitted second degree polynomials to the individual profiles. In this study we did not consider the procedure based on the sample covariance matrix.

S 1: Percentage of correct decisions for analysis based on individual profiles for models A as well as B and C with  $\rho = 0.4$

## Aorta diameter example

The data for the SGA pre term neonates are presented in Table S4.

An Excel spreadsheet with the estimates for the parameters of all models considered in Table S6 as well as data for the examples and R codes for the simulation and analyses may be downloaded from

<http://www.ime.usp.br/~jmsinger/Rocha&Singer2016.zip>

## Mucociliary speed example

S 1: Profile plots of the rows of the sample covariance matrix for data with random intercept (mucociliary speed data)

S 2: Profile plots of the rows of the sample covariance matrix for data with random intercept and slope (mucociliary speed data)

S 3: Profile plots of the rows of the sample covariance matrix for data with random intercept, slope and quadratic coefficient (mucociliary speed data)
