

Supplementary Figure S3

Supplementary Figure S3. Single-cell RNA-seq reveals the distinctive functional composition of immune cells in MET amplification patients

A, Gene expression matrix from single-cell RNA-seq experiment characterizing expression of lineage-defining genes in whole 17 immune cell clusters and gene expression matrix from CD4, CD8 and NK clusters with single-cell RNA-seq experiment characterizing expression of cell marker genes.

B, CD96 NK cell populations from isolated tumor-infiltrating lymphocytes in MET OE (overexpression) tumor model (n = 3). samples by two-sided unpaired t-test; * $p < 0.05$.

C-H, Single-cell gene set enrichment scores of IFN γ (**C, E, G**) and IFN β (**D, F, H**) response signature scores within individual immune subpopulations (CD4, CD8 and NK) from MET amplification and MET WT patients PBMCs. (Kolmogorov-Smirnov test; * $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$, and **** $p < 0.0001$).
