

Supplementary Figure S4

Supplementary Figure S4. Ibudilast inhibits MIF expression in UM cells and in hepatocytes. **A.** Western blot analysis of UM cells for the expressions of MIF after treatment with increasing doses of ibudilast for 48 hours. **B.** Expression of MIF in hepatocytes before and after treatment with 92.1-exo, with or without 25 μM ibudilast. **C.** UM cells and hepatocytes were treated with increasing doses of ibudilast for 3 days and cell viability was analyzed. Values are expressed as percentage of untreated controls. Means \pm sd of three experiments conducted in triplicates are shown. **D.** Immunoblotting showing expression of MIF in a panel of UM cell lines and normal melanocytes.
