

Supplementary Figure S1. Plasma IL-1 β level is increased and correlates positively with IRAK1 expression in SLE patients. (A) Plasma IL-1 β levels evaluated by ELISA in 77 SLE patients and 40 healthy controls. Bars indicate the median and IQR. P values were computed by the Mann-Whitney U test. (B) Correlation between IL-1 β and IRAK1 in patients. Correlations were determined by Spearman's rank correlation test.
