## 1. Synthesis of 2-chloroimidazole (2-cim)

To a 300-mL, three-neck, round-bottom flask equipped with a magnetic stirrer and argon inlet, were added *N*-tritylimidazole (3.14 g, 0.01 mol) and anhydrous THF (140 mL). The stirrer was started, and the solution was cooled to -78 °C (acetone/dry ice). *n*-BuLi (2.5 M in hexanes, 8.0 mL, 0.02 mol) was added via syringe resulting in reddish solution. This solution was stirred for 60 min whereupon hexachloroethane (5.0 g, 0.021mol) in THF (25 mL) was added in portions. The reaction mixture was stirred for 1 additional hour and then quenched with saturated aqueous ammonium chloride (100 mL). The cooling bath was removed, and when the reaction flask reached room temperature the contents were transferred to a 500 mL separatory funnel, extracted with ethyl acetate (50 mL × 2). The organic layer was separated, washed with water and brine, and dried over anhydrous sodium sulfate. After filtration, the solvents were evaporated under reduced pressure resulting in a slightly yellow solid. The solid was refluxed with 5% acetic acid in methanol (75 mL) for 24 hours. Upon evaporation of the solvent, water was added to the residue. Extraction with hexanes effectively removed the triphenylmethane impurity. Evaporation of water *in vacuo* afforded off-white solid as pure 2-chloroimidazole (2-cim, 0.70 g, 69% overall yield from *N*-tritylimidazole).

## 2. Crystal growth of 1-3

Zinc nitrate hexahydrate (120 mg, 0.4 mmol) and 2-cim (108 mg, 1 mmol) were added to methanol (4 mL) in a glass vial. The mixture was homogenized by sonication for 2 minutes. Then the vial was capped and placed into 100 °C oven for 2 days. Colorless polyhedral crystals of **1** were obtained (42 mg). Similarly, crystals of **2** (55 mg) were

obtained by reacting zinc nitrate hexahydrate (121 mg, 0.4 mmol) and 2-bim (120 mg, 0.8 mmol) in ethanol (95%, 4 mL) for 2 days.

To a mixture of 2-methylimidazole (0.20g, 2.5 mmol) and zinc nitrate hexahydrate (0.35g, 1.2 mmol) in a glass vial was added *N,N*-dimethylformamide (DMF, 15 mL). Three drops of concentrated nitric acid was added to the suspension to obtain a clear solution. The vial was capped and placed in an isothermal oven at 120 °C for 2 days. Big polyhedral crystals were obtained (40 mg, see **Figure S1**).

### 3. Selected crystallographic and thermal data of 1, 2 and 3

Table 1. Crystal data and structure refinement parameters for 1.

---

Empirical formula	C8.1 H12.4 Cl2 N4 O2.1 Zn
Formula weight	335.42
Temperature	100(2) K
Wavelength	0.71073 Å
Crystal system	Cubic
Space group	I-43m
Unit cell dimensions	a = 16.9824(4) Å $\alpha = 90^\circ$ . b = 16.9824(4) Å $\beta = 90^\circ$ . c = 16.9824(4) Å $\gamma = 90^\circ$ .
Volume	4897.8(2) Å <sup>3</sup>
Z	12
Density (calculated)	1.365 Mg/m <sup>3</sup>
Absorption coefficient	1.829 mm <sup>-1</sup>
F(000)	2036
Crystal size	0.19 x 0.08 x 0.05 mm <sup>3</sup>
Theta range for data collection	1.70 to 30.49°.
Index ranges	-24 ≤ h ≤ 24, -23 ≤ k ≤ 24, -24 ≤ l ≤ 24
Reflections collected	21497
Independent reflections	1415 [R(int) = 0.0265]
Completeness to theta = 30.49°	100.0 %
Absorption correction	Semi-empirical from equivalents
Max. and min. transmission	0.9141 and 0.7226
Refinement method	Full-matrix least-squares on F <sup>2</sup>
Data / restraints / parameters	1415 / 0 / 70
Goodness-of-fit on F <sup>2</sup>	1.009
Final R indices [I > 2σ(I)]	R1 = 0.0257, wR2 = 0.0654
R indices (all data)	R1 = 0.0264, wR2 = 0.0660
Absolute structure parameter	0.005(14)
Largest diff. peak and hole	0.651 and -0.243 e.Å <sup>-3</sup>

#### 4. Adsorption measurement

Adsorption measurements were made using a computer controlled thermogravimetric balance consisting of a TA51 electrobalance and associated TA-2000/PC control system. This one atmosphere, gas flow through electrobalance system was controlled via Macintosh-based LabView control software, Kinetic Systems interface, mass flow controllers and Eurotherm temperature controller. The samples were activated at 300 °C (400 °C for **3**) for 2 hours in dry nitrogen prior to the sorption measurement. All isotherm data are fitted with the Langmuir equation.  $D/r^2$  values are obtained by applying Crank's solution for diffusion in a plane sheet adsorbent (Crank, 1957).
