

Supporting Information: Figure S5

Distributions of angles characterizing conformations of triglyceride molecules. Solid lines are for the coarse-grained model and dashed lines for the atomic scale model (obtained from A. Hall et al., J Phys Chem B **112**, 13772 (2008)). The angles are defined between vectors from the central bead to the end of each chain. α corresponds to the angle between the $sn-1$ and $sn-3$ chains, β between the $sn-2$ and $sn-3$ chains, and γ between the $sn-1$ and $sn-2$ chains.
