Figure S1. Topology resulting from the Maximum Likelihood analysis of the *Magallana* COI dataset (subset of full tree). Numbers above the branches represent bootstrap support values, only values over 50 are shown and some internal values have been removed for clarity. Scale bar indicates substitutions per site. Specimens sequenced in this study are indicated with a star; all fall within a well-supported clade containing sequences from specimens identified as *Crassostrea madrasensis* or *C. iredalei.*
