

# Relation of Childhood Home Environment to Cortical Thickness in Late Adolescence: Statistical Analysis

Brian B. Avants, Daniel A. Hackman, Laura Betancourt, Gwen M. Lawson, Hallam Hurt,  
Martha J. Farah

April 16, 2015

Eigenanatomy was run on the full cohort to produce the summary regions contained in the csv file herein named `home_53_figshare.csv`.

The eigenanatomy vectors contain values greater than or equal to zero. We employed the first 30 projections as described in the paper.

The eigenanatomy vectors are applied to scaled matrix data s.t. the columns 1 to 30 in `home_53_figshare.csv` were computed via

$$E_p = X_{\text{thickness}} E_v$$

where  $X_{\text{thickness}}$  is the  $n \times q$  scaled thickness matrix for all  $n$  subjects,  $q$  denotes the number of voxels in the template cortical mask and  $E_v$  denotes the matrix of sparse eigenanatomy vectors.

The variables within the csv are described in Table 1 below.

variableName	description
csn	Maternal use of cocaine during pregnancy
sexn	Gender
myage	Age at scan
FSIQ18	Full Scale IQ age 18
pfullsiq	Parental IQ
avcogZ4	Cognitive stimulation of home environment age 4
avemotZ4	Nurturance of home environment age 4
Fost	Ever in foster care?
