

The distribution of the iris colour index of each group:

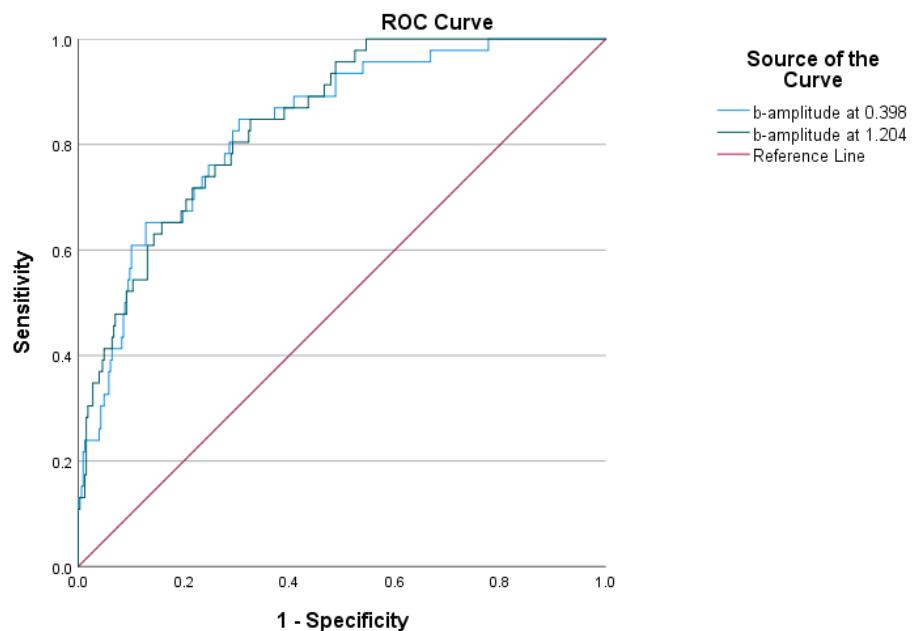

ROC Curve - ADHD as Positive; ASD & CTL as negative

Case Processing Summary

Whether it's ADHD	Valid N (listwise)
Positive ^a	46
Negative	328
Missing	18

Larger values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is ADHD.

Area Under the Curve

Missing	12
Total	392

Larger values of the test result variable(s) indicate

stronger evidence for a positive actual state.

a. The positive actual state is ADHD.

The test result variable(s): b-time at 0.398 has at least one tie between the positive actual state group and the negative actual state group.

- a. The smallest cutoff value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cutoff values are the averages of two consecutive ordered observed test values.

The test result variable(s): b-time at 0.398 has at least one tie between the positive actual state group and the negative actual state group.

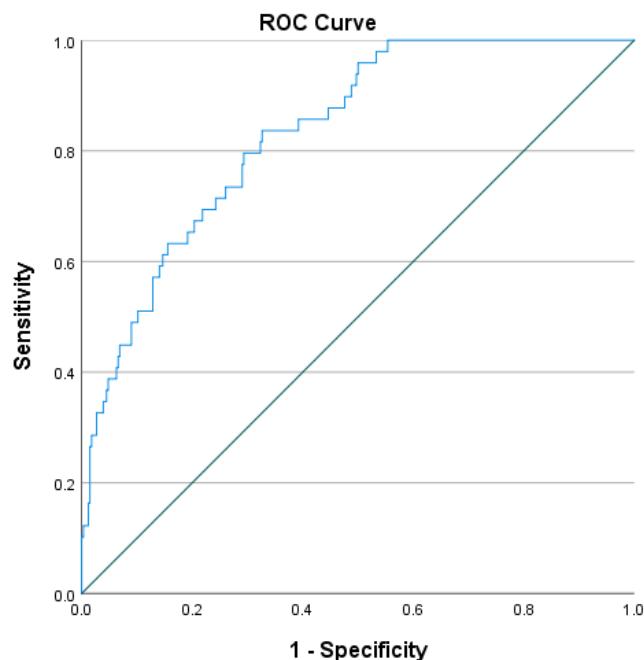

- a. The smallest cutoff value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cutoff values are the averages of two consecutive ordered observed test values.

Case Processing Summary

Whether it's ADHD	Valid N (listwise)
Positive ^a	49
Negative	334
Missing	9

Larger values of the test result variable(s) indicate stronger evidence for a positive actual state.
 a. The positive actual state is ADHD.

ROC Analysis - ADHD vs ASD+CTL

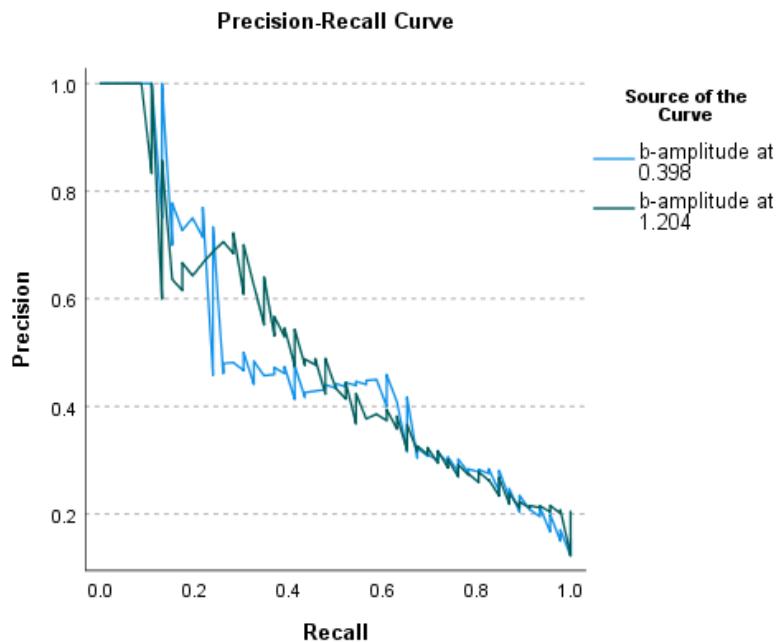

Case Processing Summary

Whether it's ADHD	Valid N (listwise)
Positive ^a	46
Negative	328
Missing	18
Total	392

Larger values of the test result variable(s) indicate stronger evidence for a positive actual state.

a. The positive actual state is ADHD.

Area Under the ROC Curve

- a. The smallest cutoff value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cutoff values are the averages of two consecutive ordered observed test values.

ROC Analysis - Just between ADHD and ASD groups

Case Processing Summary

No control	Valid N (listwise)
Positive ^a	46
Negative	158
Missing	188
Total	392

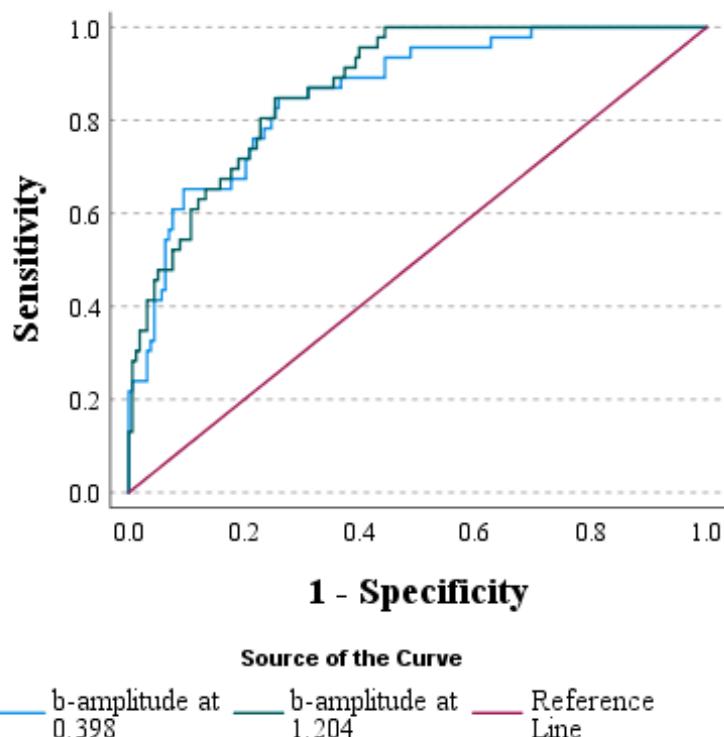

Larger values of the test result variable(s)

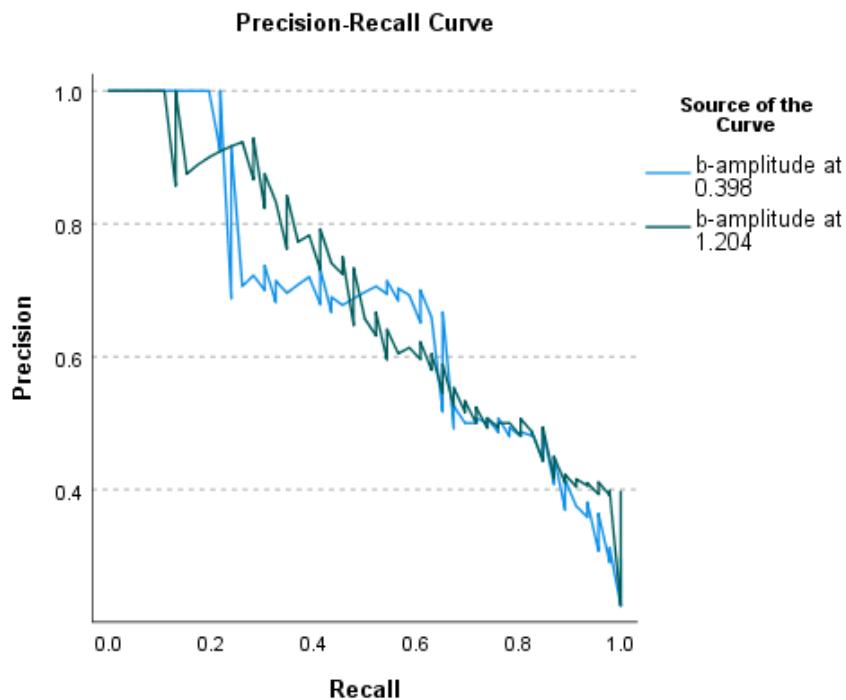

indicate stronger evidence for a positive

actual state.

a. The positive actual state is ADHD.

- a. The smallest cutoff value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cutoff values are the averages of two consecutive ordered observed test values.

**A good model has a value above 0.5
 A value less than 0.5 indicates the model is no better than
 random prediction**

Note: Use caution in interpreting this chart since it only reflects a general measure of overall model quality. The model quality can be considered "good" even if the correct prediction rate for positive responses does not meet the specified minimum probability. Use the classification table to examine correct prediction rates.

- a. The smallest cutoff value is the minimum observed test value minus 1, and the largest cutoff value is the maximum observed test value plus 1. All the other cutoff values are the averages of two consecutive ordered observed test values.

ROC Analysis - ASD vs CTL

Case Processing Summary

ASD vs Control	Valid N (listwise)
Positive ^a	158
Negative	170
Missing	64
Total	392

Larger values of the test result variable(s) indicate stronger evidence for a positive actual state.

- a. The positive actual state is ASD.
