

Supplemental Figure 2. Pancreatic insulin staining is elevated with endocrine therapy in LFLS and HFHS fed mice. Images of pancreas from one animal in each group showing insulin positive cells measured by IHC. LFLS E_2 (n=5), LFLS E_2 +TAM (n=6), LFLS EWD (n=4), HFHS E_2 (n=4), HFHS E_2 +TAM (n=6), HFHS EWD (n=6). Bottom, the proportion of insulin positive out of total pixels. (main effect $p < 0.05$; factors: diet and individual treatments; 2x2 ANOVA).
