

Figure 1. Chemical diagrams for the Purrido amphibolites. (a) Nb/Y-Zr/Ti diagram of Winchester and Floyd (1977; Chemical Geology, 20, 325-343) modified according to Pearce (1996; Short Course Notes, Geological Association of Canada, 12, 79-113). (b) Incompatible element ratio plot of Ta/Yb-Th/Yb (after Pearce, 1983; Continental basalts and mantle xenoliths, Shiva, Nantwich, 230-249). (c)Ti-Zr-Y tectonic discrimination diagram (Pearce and Cann, 1973; Earth and Planetary Science Letters, 19, 290-300). (d) N-MORB-normalized trace element patterns of the composition of each amphibolite sample; normalizing values are from Pearce (1996). In the last plot the negative Nb anomaly and the relative depletion in some elements are compatible with a subduction related origin.
