<!--Simplified DFG and DDG for Create Interpolation Model sequence in Cflux  
Analytic Web-->
```

```
<!--Though this excerpt contains references to other parts of the Analytic Web  
(e.g., Merge Data), the complete Analytic Web is self-contained.-->
```

```
<!--SciWalker performs the transformations required to exchange objects with R.  
In this case, data' (the object submitted to R) is created from data by extracting  
the dependent and independent variables (mco2flux and tsoil). Similarly, model  
is created from model' (the object returned by R) by extracting the regression  
coefficients (a and b). Though these transformations are not explicitly  
represented in the DFG and DDG, the code used to implement them would be  
archived and documented for a particular version of SciWalker.-->
