

Supplemental File 2. Kaplan-Meier plots for variables that were significantly associated with viral suppression and virologic failure in multivariate models.

A

B

Footnotes for Supplemental File 2:

Kaplan-Meier (KM) plots were generated for variables that were significantly associated with (A) viral suppression (see Table 2) and (B) virologic failure in multivariate models (see Table 3). Dichotomized values were used for CD4 cell count and viral load in the KM analyses. In contrast, CD4 cell count and viral load were analyzed per 100 CD4 increment and per unit \log_{10} viral load increment, respectively, in the analyses shown in Tables 2 and 3. Overall, the results from Cox models shown in the KM plots indicate that the proportional hazards assumption used for analysis in Tables 2 and 3 is reasonable.
