Supplementary Table S3, Foster et al

All chromosomal rearrangements detected by M-FISH/aCGH in eight cervical SCC cell lines

All rearrangements detected in the present study are given, as well as a comparison with data from the previous SKY/mCGH investigation (Harris et al. 2003). For those identified in this study, the percentage of metaphases in which the abnormality was detected is given. Codes: 'C'= common to both studies, 'CR'= common to both studies but refined in the present investigation, 'N'= novel to this study, 'A'= absent in this study but present in the SKY report.

Supplementary Table S4. Identification of Recurrent Breakpoints

- **A**. Recurrent breakpoints (present in two or more derivative chromosomes) identified by M-FISH and aCGH. Bold text indicates breakpoints in bands known to contain common fragile sites.
- **B**. Recurrent breakpoints common to the current investigation and the previous SKY/mCGH study [Harris et al., 2003].

Supplementary Results

Comparison with reported karyotype analysis of independent cell stocks

Consistent with the increased cytogenetic resolution of M-FISH/aCGH compared to SKY/mCGH, we consider that we were able to refine the analysis of 7 of the rearrangements identified in both studies. These abnormalities are coded 'CR' in Supplementary Table S3. We identified 2 derivative chromosomes in SiHa that contained insertions in chromosome X: ins(X;3)(p11;q24) and der(X)t(X;5)(p22;?) ins(X;3)(p11;q24)t(X;12)(q27;?) (fig. 1). Based on the karyotypes provided [Harris et al., 2003], we conclude that these chromosomes were present in the cells examined by SKY but at least one was interpreted as a normal copy of chromosome X. We further identified that the derivative chromosome in HT-3 previously reported as a der(3)t(3;21;6) is actually a der(3)t(3;8;6). We believe that the novel reciprocal translocation detected in MS751, t(8;12)(p22;p12), was probably also present in the MS751 cells assessed by SKY. However, only one derivative (the der(12)t(8;12)) was detected by SKY [Harris et al., 2003], suggesting that the corresponding der(8)t(8;12) was misclassified, apparently as a normal chromosome 8.

Thirty-eight of the 181 structural abnormalities reported in the previous SKY/mCGH study [Harris et al., 2003] were not detected by us, including the reciprocal translocation t(X;10) in C-33A. Another 4 rearrangements were seen by us, but only in a single metaphase and were therefore not included in our composite karyotypes. The SKY/mCGH analysis reported identifying 51 recurrent breakpoints, although these were not listed. Of the 53 identified in the present investigation (using criteria identical to those in the SKY/mCGH study), only 21 appear to have been consistent between the 2 studies (Supplementary Table S4B), based on our analysis of the SKY composite karyotypes [Harris et al., 2003]. The SKY/mCGH study did report 15 breakpoint clusters, although only 2 overlapped with the 9 clusters seen by us (those at 5p13 and 8q11). Interestingly, 8q11 was among the three breakpoint clusters identified by us in 4 different cell lines (see above).
