

Colenso's *Glossarium Botanicum Novae Zelandiae* and Cunningham's *Florae Insularum Novae Zelandiae Precursor*: numbering, and concordance between historic and current botanical names

Clem Earp

The tables in this document are an attempt to supply a concordance between botanical names in current use and the historic specific names in both the checklist portion of William Colenso's *Glossarium Botanicum: Novae Zelandiae* and Allan Cunningham's *Florae Insularum Novae Zelandiae Precursor*. By 'current use' is meant that the names are accepted in the Flora of New Zealand Online (Breitwieser et al. 2016, hereafter FNZO) for vascular plants, in the online database Ngā Tipu o Aotearoa (Allan Herbarium 2016, hereafter NTA) for bryophytes, in Algaebase (Guiry & Guiry 2016, hereafter AB) for seaweeds, and in the lichen volumes of the *Flora of New Zealand* (Galloway 1985, 2007).

In the first table, only those names in the classes covered by both the *Glossarium* and *Precursor* are treated, i.e. vascular plants and bryophytes. The entries are in the same order of appearance as in the *Glossarium*, and their ordinal numbers in the *Precursor* are given where applicable. In the second table those classes which appear only in the *Precursor* are covered, i.e. seaweeds and lichens.

In the first table, where a blank appears in the column for *Glossarium* numbers (headed **G #**), it should be assumed that these entries were present but not numbered by Colenso; but if a blank appears in the column for *Precursor* numbers (headed **P #**), it should be assumed that the entry does not appear at all in the *Precursor*. Three entries that were omitted from the printed text of the *Precursor* by typographic errors (a seaweed at no. 30, and mosses at nos 98 and 99) are restored here from Cunningham's manuscript. A number of other irregularities will be seen in the numbering of the *Precursor*, due to typographic errors in the printed text.

When the historic name is given in a synonymy within the current work of reference, the concordance is simple. However, when the historic name does not appear in the current synonymy (and, for example, FNZO does not list all the synonyms given by Allan 1961), more than one authority is given, with the leftmost containing the historic name and the rightmost the current name, in a chain linked by common synonyms.

Where no reference is cited, it should be assumed that my own opinion is involved. In a few cases I have put 'auctt.' where this is my opinion based on too many other works to cite.

This document should not be taken as definitive. Because of the state of knowledge of New Zealand botany at the time Colenso constructed his checklist, some species cannot be identified with absolute certainty without further research, or perhaps, not even then. This is particularly the case for seaweeds and lichens, where the earliest botanists attributed cosmopolitan species to New Zealand, which later systematists – even near contemporaries like the Hookers and their co-workers – found difficult when the time came for better discrimination. In addition, nomenclature is always subject to change, particularly in those two classes.

Species marked with an asterisk * are exotic; those marked with † were mistakenly attributed to New Zealand.

Table 1: Classes covered by both *Glossarium & Precursor* 5

Table 2: Classes covered by *Precursor* only 24
