

SUPPLEMENTARY MATERIALS

Santantonio, N., Jannink, J., Sorrells, M. 2018. Prediction of sub-genome additive and interaction effects in allohexaploid wheat. G3.

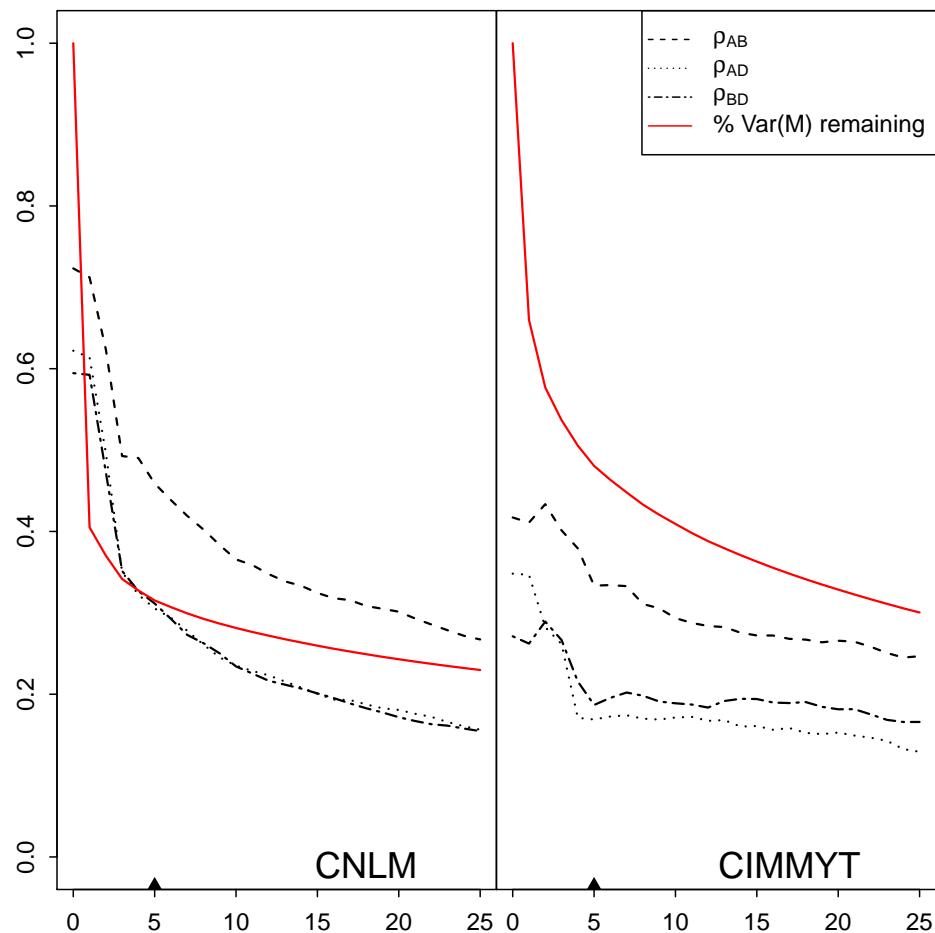

Figure S1 Correlation coefficient, ρ , of off-diagonal elements of estimated additive covariance matrices \mathbf{K}_A , \mathbf{K}_B and \mathbf{K}_D . The percent genotype marker variance remaining in the marker matrix after removing k dimensions is shown in red. The chosen population structure dimension $k = 5$, is indicated by a ▲.

^a Equation

^b Variance component estimates reported for additive main effects (G, A, B and D) and epistatic interactions (H, A×B, A×D, B×D) are the ratios of the actual variance component to the residual variance component for ease of comparison.

^c The variance component divided by their respective standard errors are shown in parentheses.

^d The residual variance components are the actual estimates from the centered and scaled data (refer to Table ?? for scaling coefficients) with their associated standard errors in parentheses.

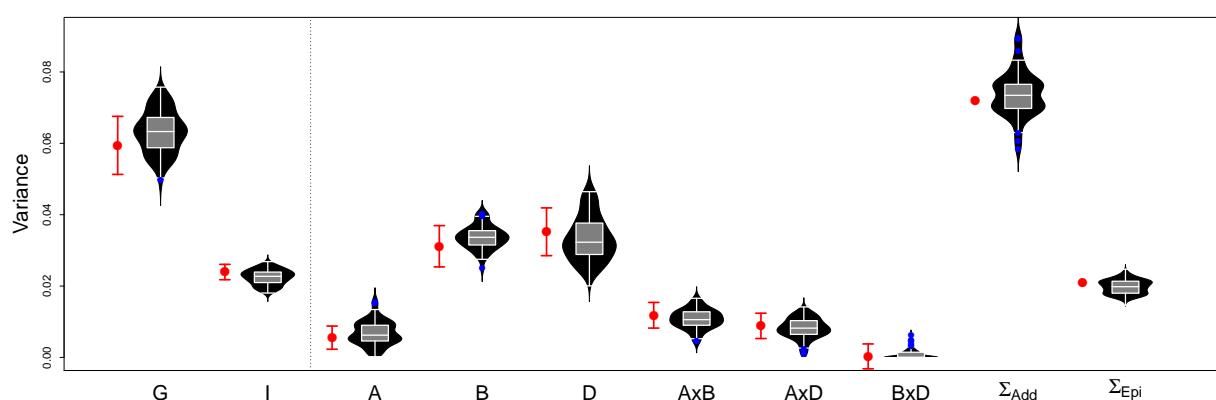

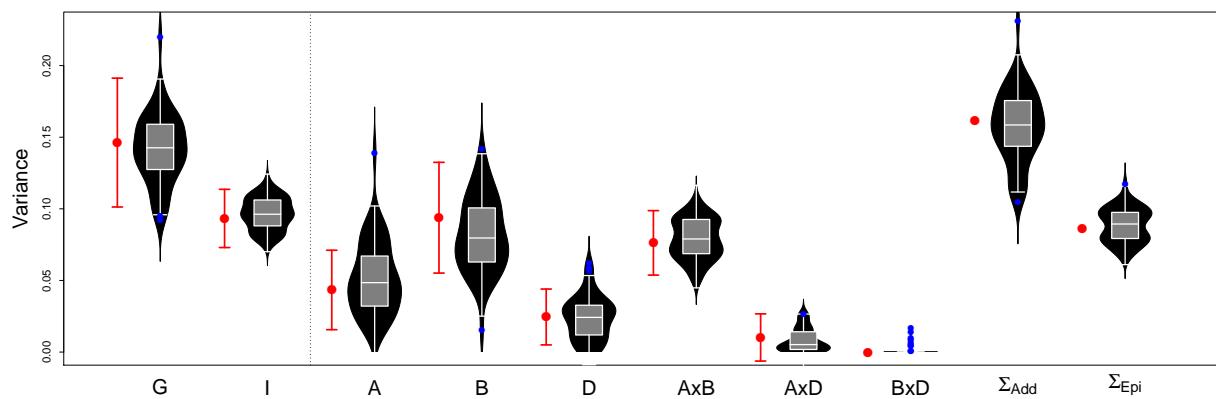

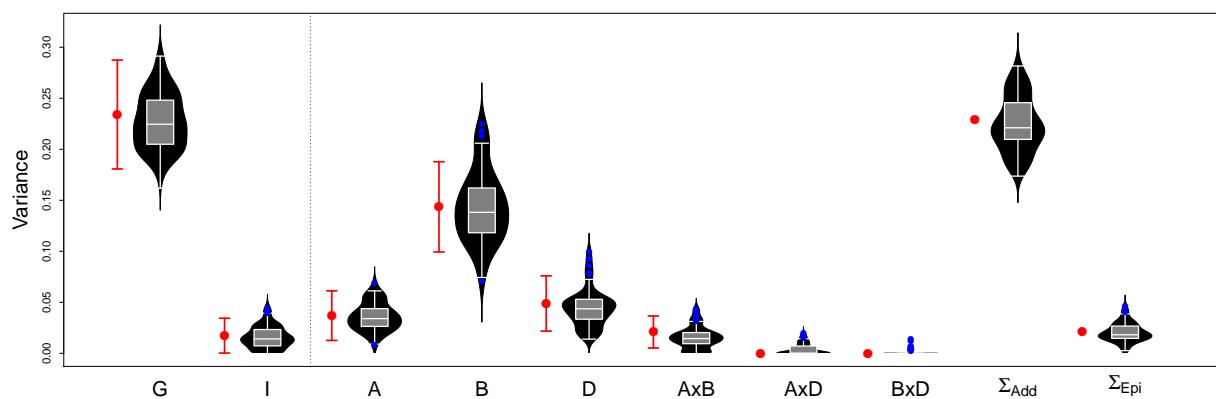

Figure S2 Estimates and standard errors of variance components for four traits in the CNLM populations from the full model (red) compared to the sampling distribution of variance component estimates from the cross-validation scheme (black violins). $G \times G$ (5) and $ABD \times ABD$ (7) models are shown to the left and right of the dotted line, respectively. The sum of the additive (Σ_{Add}) and epitstatic (Σ_{Epi}) variance components is also shown for the $ABD \times ABD$ model.

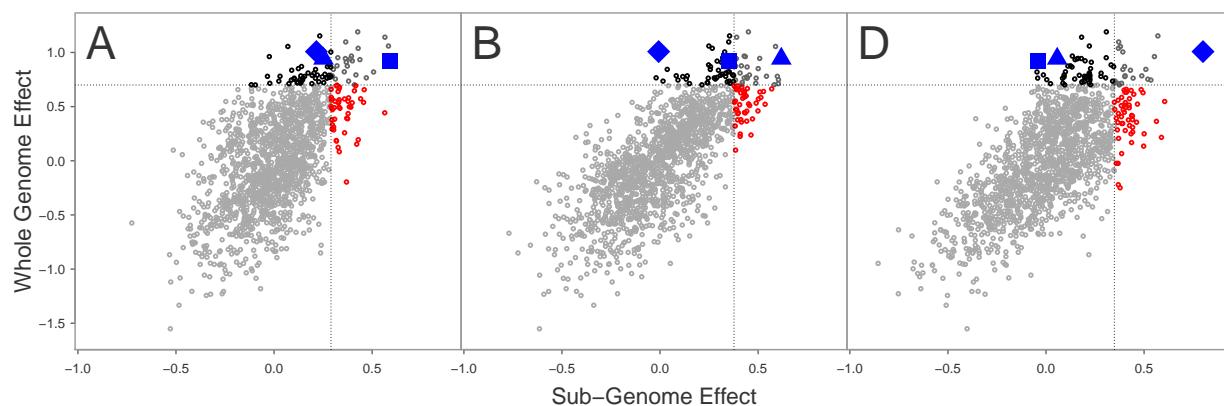

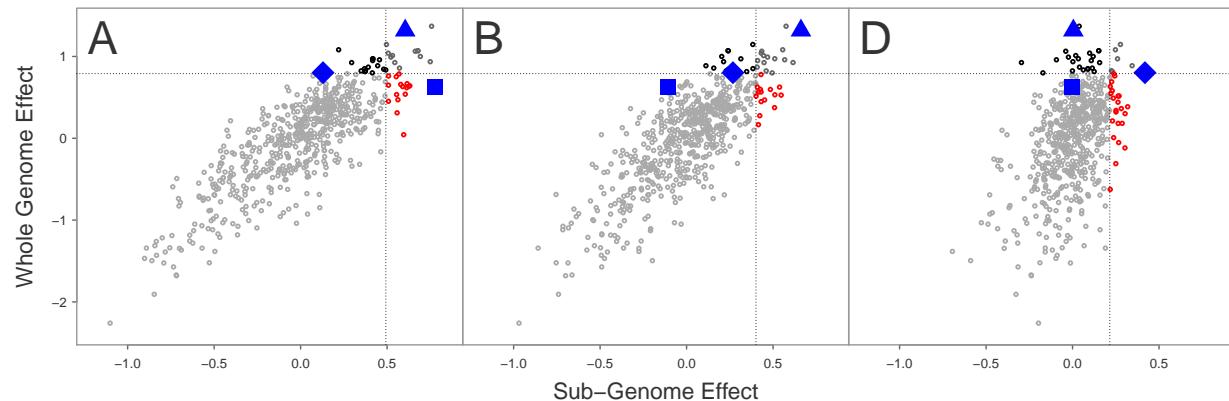

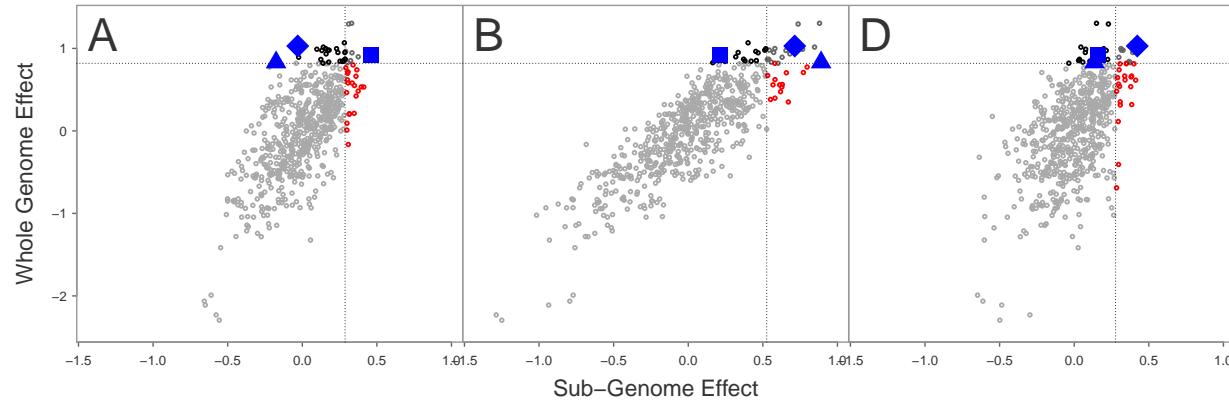

Figure S4 Plot of whole genome additive effects (GEBV) by subgenome additive effects (SGEBV) for four traits in the CNLM populations. The dotted line indicates the 95% quantiles for whole or subgenome effects. Blue squares, triangles and diamonds indicate the line with the highest SGEBV for each of the A, B and D subgenomes, respectively.
