# Overview

- Background
  - Deep Learning
  - Model Integrated Computing
- Core Concepts
- Platform
  - Design Goals
  - Architecture
- Future Work
- Demo

# Background

# Deep Learning

- A *deep neural network* is an artificial neural network with multiple hidden layers
- Flexible enough to be applied to a number of problems:
  - Speech-to-text
  - Image segmentation
  - Image classification
  - Learning embeddings
  - Styling images
  - etc
- State of art in almost everything

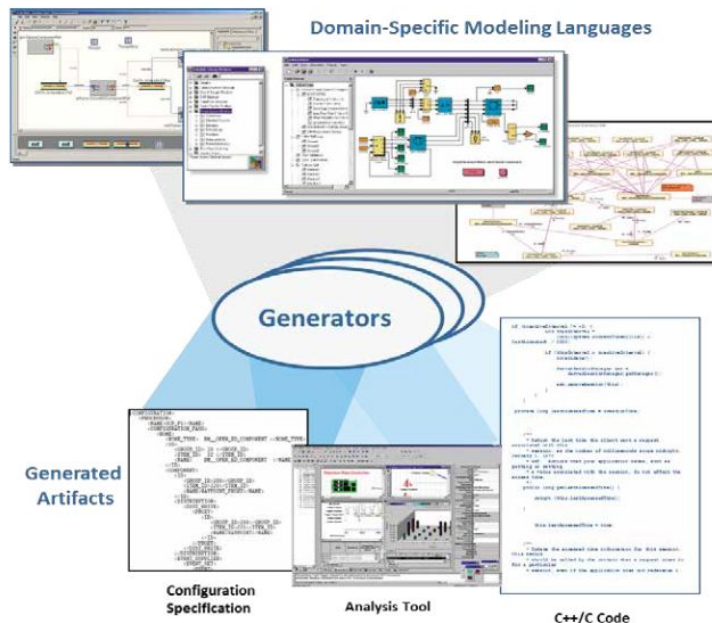

# Model Integrated Computing

- The process of using domain specific abstractions for developing systems or applications
- The domain specific model is at the center of the workflow
- Aids in the design and implementation of complex systems

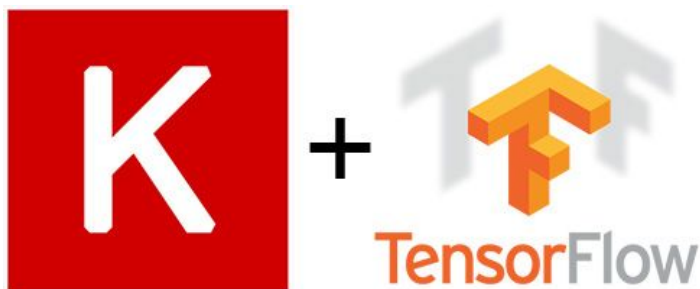

# Keras + Tensorflow

- Keras
  - High-level neural networks API in Python
  - Frontend for multiple deep learning frameworks
- TensorFlow
  - Open source machine learning framework in Python
  - Supports many different deployment platforms from clusters to mobile devices

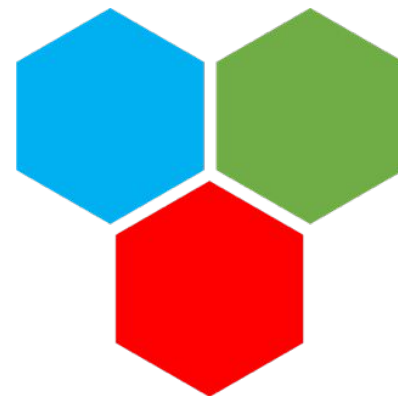

# WebGME

- An MIC framework for creating domain specific development environments
- Meta-configurable (provides a modeling language for creating modeling languages - similar to UML)
- Provides a number of useful features including version control and collaborative editing
- More information available at <https://webgme.org>

# Core Concepts

# Core Concepts

- Two different types of concepts:
  - Concepts for creating executable pipelines
  - Concepts for designing neural network architectures
- Four main concepts are creating executable pipelines
  - Operations
  - Pipelines
  - Jobs
  - Executions
- Two high-level concepts for designing neural networks architectures
  - Architectures
  - Layers

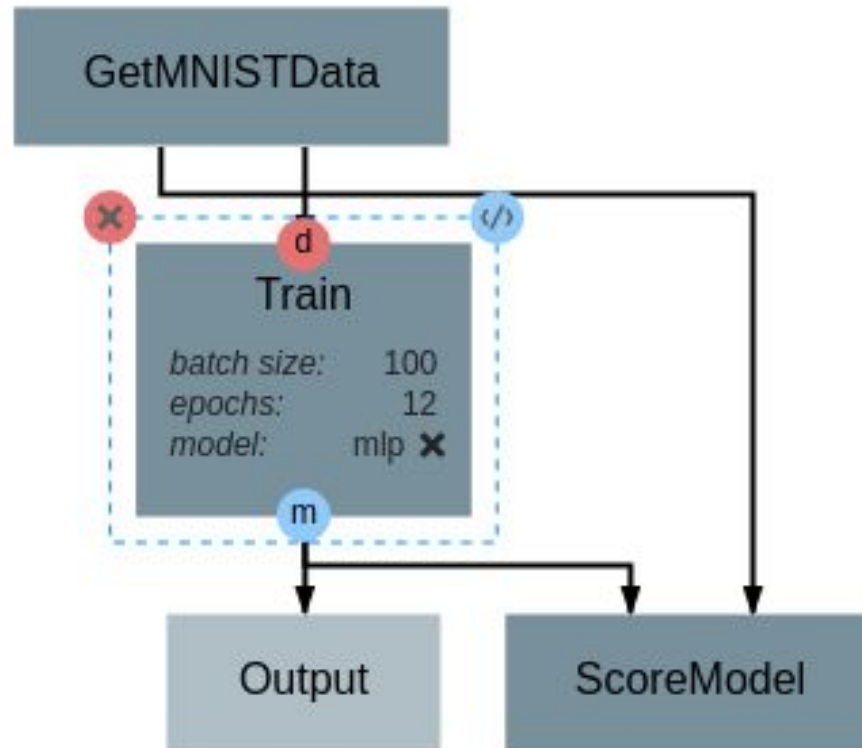

# Pipeline Concepts

- **Operations** are functions with multiple, named inputs and outputs
- Attributes and references can be set at design time to specify configurable parameters
  - For example, *iterations* may be specified in a training operation
- **Pipelines** represent some machine learning task composed of operations
  - Examples include training, prediction, or data augmentation
- Pipelines can also contain *Input* and *Output* operations to specify inputs/outputs of the entire pipeline

# Example Pipeline

# Pipeline Concepts

- **Jobs** are executable operations which contain the operation definition and metadata about the execution
  - This includes console output and plots
- **Executions** represent an executable instance of a pipeline (composed of jobs)

Platform

# Platform

- Web-based platform with 3 driving design goals:
  - Accessibility
  - Rapid Development
  - Reproducibility
- Developed using WebGME

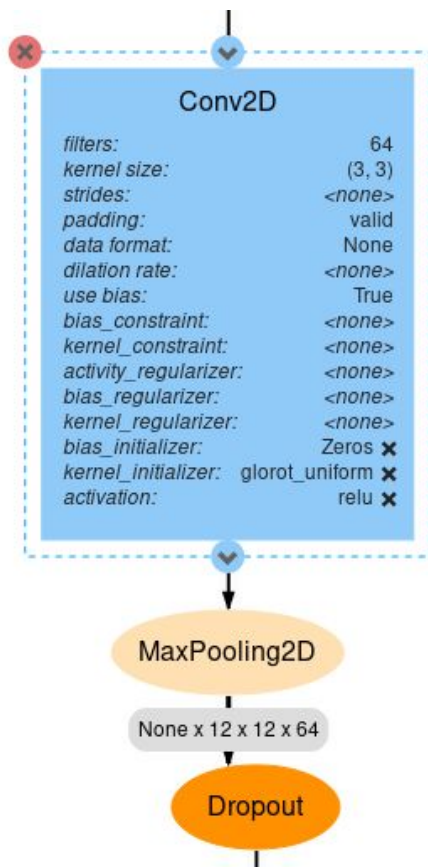

# Accessibility

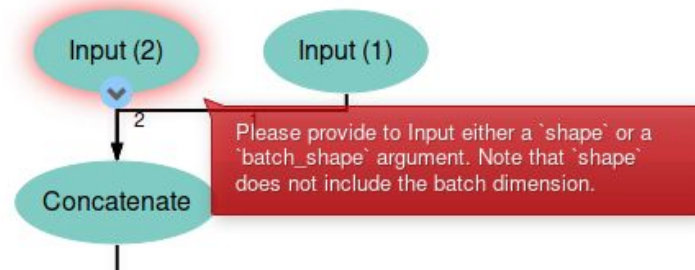

- Goal: Make deep learning easily accessible to other domains
- Enforce domain semantics (and constraints)
- Immediate neural network validation and feedback
  - Error feedback
  - Dimensionality information
- Utilize a hybrid visual-textual interface
  - Use the appropriate modality for the given task

# Enforcing Domain Semantics: Building a Neural Network

Dimensionality Feedback

### Train

```
-2 # Editing "Train" Implementation
-1 #
# The 'execute' method will be called when the operation is executed
1 from __future__ import print_function
2 import keras
3
4 class Train():
5     def __init__(self, model, epochs=12, batch_size=100):
6         self.model = model
7         self.batch_size = batch_size
8         self.epochs = epochs
9         return
10
11
12     def execute(self, data):
13         (x_train, y_train) = data
14         model = self.model
15         model.compile(loss=keras.losses.categorical_crossentropy,
16                       optimizer=keras.optimizers.Adadelta(),
17                       metrics=['accuracy'])
18
19         model.fit(x_train, y_train,
20                 batch_size=self.batch_size,
21                 epochs=self.epochs,
22                 verbose=1)
23
24         return model
25
```

IN SYNC NOTIFICATIONS [0] CONNECTED

# Rapid Development

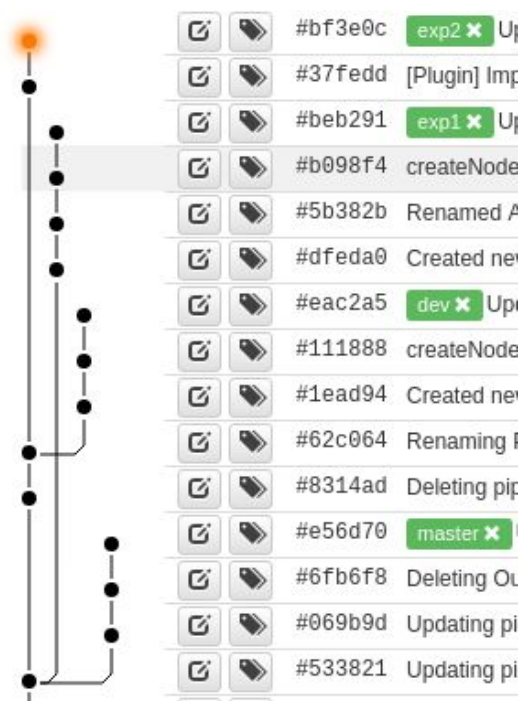

- Productivity during development was another key design decision
- Collaboration capabilities
  - Real-time collaborative editing
  - Integrated version control allows for working on isolated branches
- Support the entire development lifecycle
  - From initial creation to execution and subsequent iterations
  - Execute and monitor pipelines from the browser

# Reproducibility

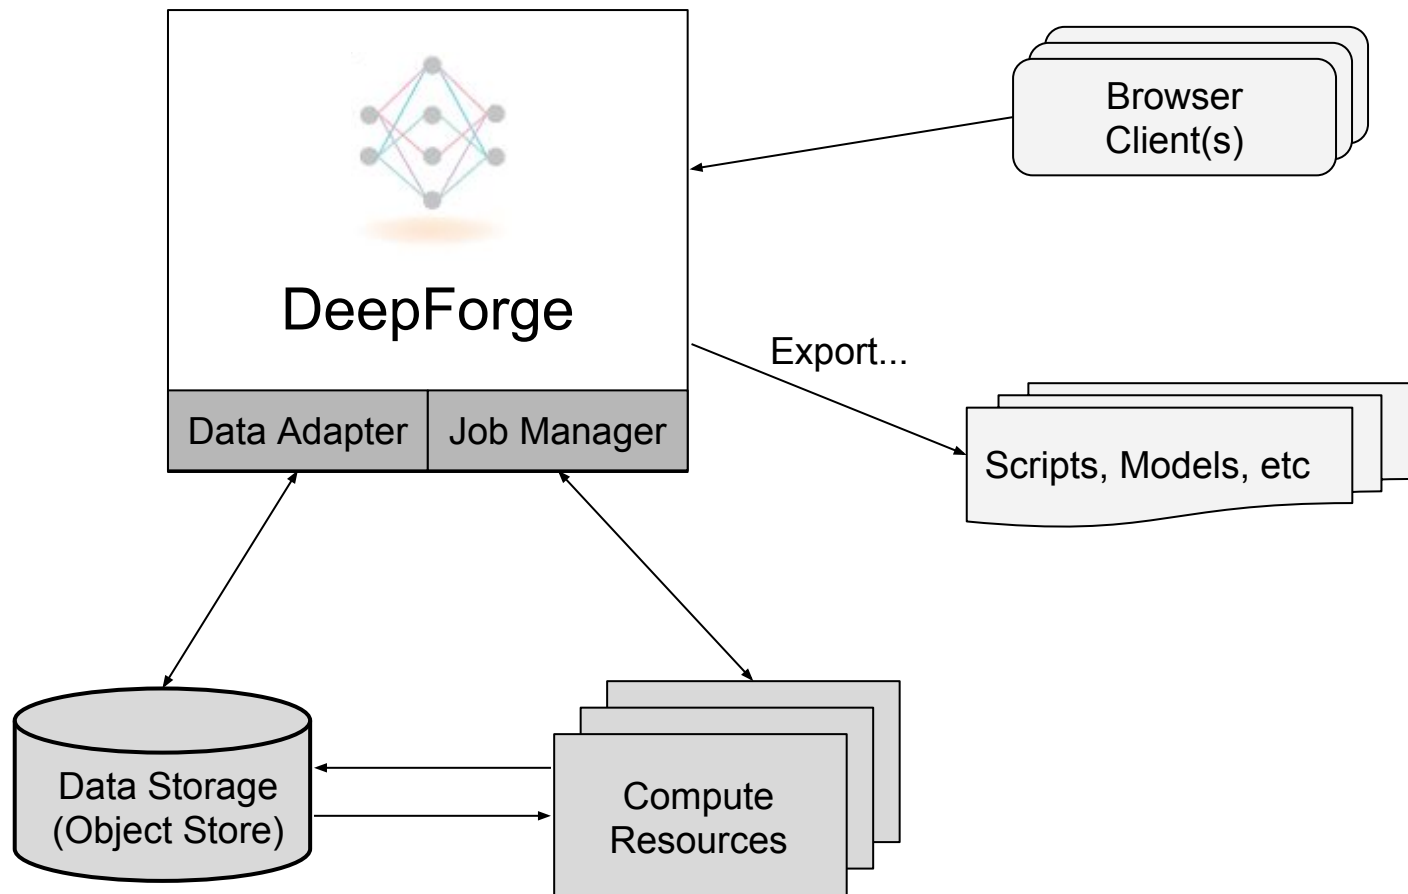

- Integrated version control of project content
- Blob data is referenced by hash in the project content
  - This includes datasets, trained models, etc
- Both data and the code are reproducible
- Automatic tagging commits when executing pipelines

# Architecture Overview

# Future Work

- Add integrations with scientific infrastructure
  - data sources
  - computational resources
- Registry for hosting project resources
  - operation definitions
  - architectures
  - trained models
- Add more data introspection utilities
- Model introspection utilities
- Architecture editor improvements
  - Parameterization
  - Composable

Demo
