

Table S4

*Partial Spearman's rank-order correlations, controlling for effects of familiarity, between ratings of complexity, pleasantness and arousal in response to representational paintings (N = 96).*

Group		Complexity
f (df = 85)	Pleasantness	.01
m (df = 84)		-.05
All (df = 83)		-.08
f (df = 85)	Arousal	.50*
m (df = 84)		.51*
All (df = 83)		.59*

*Note.* \* $p < .05$  after Bonferroni-Holm correction; f = females; m = males; All = all participants; the *dfs* are not the same for all correlations due to slightly different numbers of outliers.
