## Computational Details

The calculations were performed using periodic density functional theory (DFT) with the Vienna Ab-initio Simulation Package (VASP version 5.2).<sup>1</sup> The (011) surface of cobalt monoxide was represented by a periodic slab model constructed using bulk cell dimensions:  $a = b = c = 4.2667 \text{ \AA}$ . Since CoO is antiferromagnetic and has atomic moment on cobalt atoms, the primitive cubic unit cell of CoO was used to build the surface slab, which was previously proved to be the most energetically stable configuration for CoO.<sup>2</sup> The repeated slabs were separated from their neighboring images by a 12 Å-width vacuum in the direction perpendicular to the surface. Considering the usually very large relaxations of the CoO surfaces, a slab containing five layers of 60 atoms was chosen. The three top-layer slabs of the surface were allowed to relax while the other layers beneath the surface were frozen during the geometry optimization. This model was previously shown to generate reasonable results.<sup>3</sup>

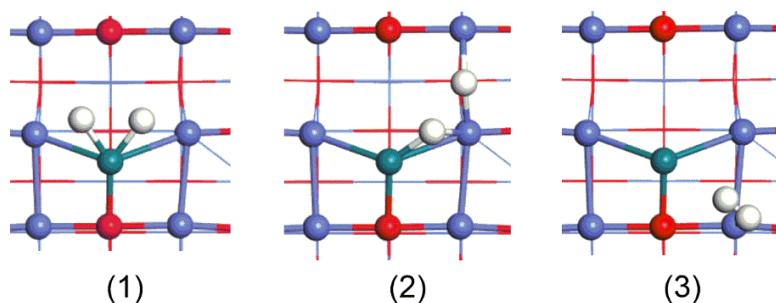

The atomic core and valence electrons were represented by the projector-augmented wave (PAW) method<sup>4</sup> and plane-wave basis functions with a kinetic energy cut-off of 400 eV. Inasmuch as Rh has non-negligible relativistic effects, the mass–velocity and Darwin scalar-relativistic effects were included through the PAW potentials. The generalized gradient approximation (GGA) with the Perdew-Burke-Ernzerhof (PBE) exchange-correlation functional<sup>5</sup> was used in the calculations. A Monkhorst-Pack grid of size of  $2 \times 2 \times 1$  was used to sample the surface Brillouin zone. The ground-state atomic geometries were obtained by minimizing the forces on the atoms to  $< 0.02 \text{ eV/\AA}$ . Because of the strong 3d-electron correlation effects for Co, the calculations were carried out with the DFT+U method.<sup>6</sup> The parameters were set at  $U = 4 \text{ eV}$  and  $J = 1 \text{ eV}$ .<sup>7</sup> The transition states were obtained by relaxing the force  $< 0.02 \text{ eV / \AA}$  by using the dimer method.<sup>8</sup>
