1. General Information:

Infrared spectra were obtained on a FTIR spectrometer. ^1H NMR and ^{13}C NMR spectra were recorded on BRUKER AVANCE III 400 spectrometer. CDCl_3 were used as solvent. Chemical shifts were referenced relative to residual solvent. The following abbreviations are used to describe peak patterns where appropriate: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dq = double quartet. Coupling constants (J) are reported in Hertz (Hz). HRMS were performed on Waters GCT Premier Time of Flight Mass Spectrometer (EI) or Agilent Technologies 6224 TOF LC/MS apparatus (ESI). Melting points were measured with micro melting point apparatus.

$\text{Fe}(\text{acac})_3$, PhSiH_3 , EtOH, THF were commercially available, and the alkenes were commercially available or prepared easily. Morita-Baylis-Hillman adducts were prepared according the literature.¹

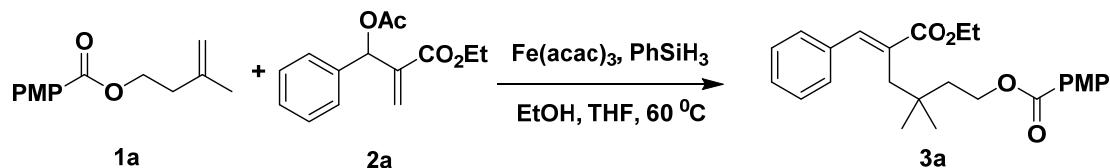

2. General Synthesis Procedure of Morita-Baylis-Hillman Adducts.

A mixture of methyl acrylate (30 mmol, 1.5 eq), aldehyde (15mmol, 1 eq) and DABCO (15mmol, 1 eq) was stirred at 50 °C for 24 hr, and then ether was added. The organic layer was separated and washed with dilute 6M HCl (30 mL), NaHCO₃ (aq) (30 mL) and water, and then dried over anhydrous Na₂SO₄. After removal of the volatile, the residue was purified by column chromatography to afford the compound **1** as oil.

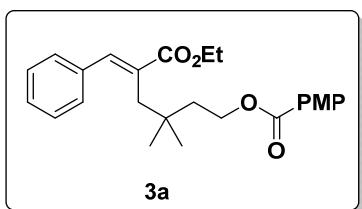

A mixture of **1** (10 mmol, 1 eq), Acetic anhydride (10 mmol, 1 eq), DMAP (1mmol, 0.1 eq) was stirred at room temperature for 1 hr. Then DCM was added. The organic layer was separated and washed with dilute aq NaHCO₃ (20 mL) and water, and then dried over anhydrous Na₂SO₄. After removal of the volatile, the residue was purified by column chromatography to afford the target product **1a**.

3. Typical Synthesis Procedure of **3a**.

A Schlenk tube containing Fe(acac)₃ (212 mg, 0.6 mmol) were evacuated and purged with Argon three times. Afterwards, alkenes **1a** (660 mg, 3 mmol), Morita-Baylis-Hillman adducts **2a** (496 mg, 2 mmol), PhSiH₃ (216 mg, 2 mmol) and EtOH (184 mg, 4 mmol), THF (10 mL) were added via syringe. The solution was kept at 60 °C until the compound **2a** was completed. Then the solution was evaporated under vacuum. The purification was performed by flash column chromatography using ethyl acetate/petroleum ether (v/v, 1:20) as eluent to give **3a** as a pale yellow liquid (656mg, 80% yield).
