UV/Vis Data for tpyNi Catalyst

UV/Vis of tpyNi

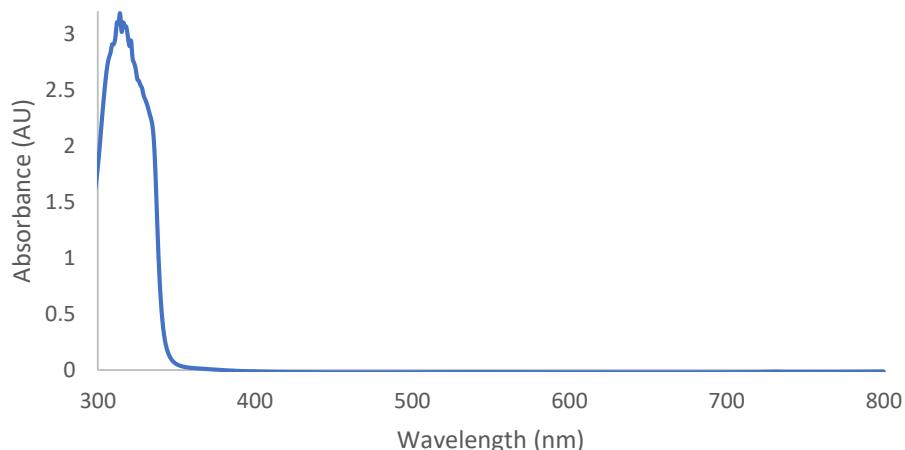

Figure SI-1. UV/Vis spectra of **tpyNi** catalyst used in the dual catalysis system. Spectra collected on a 1 mM solution of **tpyNi** in MeCN. Excitation wavelengths for cross-coupling reactions are between 400-500 nm with a maximum intensity at 480 nm.

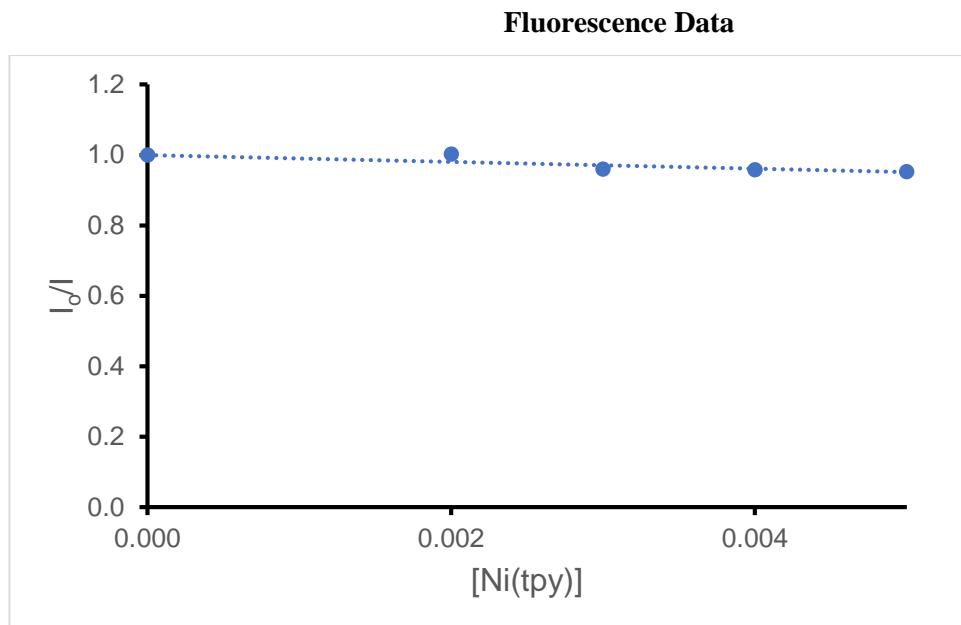

Figure SI-2. Stern-Volmer plot for the fluorescence of $\text{Ru}(\text{phen})_3^{2+}$ in the presence of varying amounts of tpyNi. $[\text{Ru}(\text{phen})_3^{2+}] = 0.005 \text{ mM}$. As evidenced by the straight line with no slope, the Ni catalyst does not quench the $\text{Ru}(\text{phen})_3^{2+}$ photocatalyst.

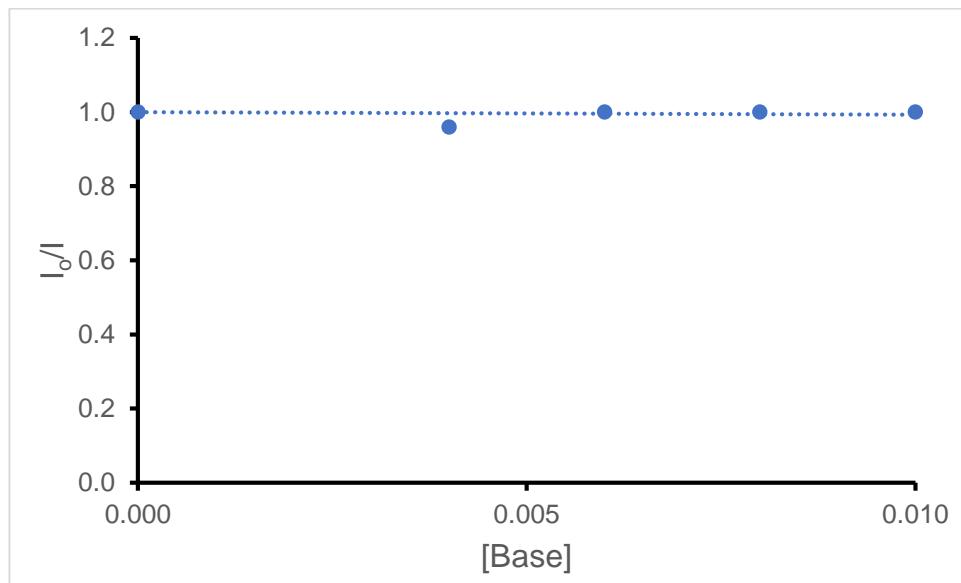

Figure SI-3. Stern-Volmer plot for the fluorescence of $\text{Ru}(\text{phen})_3^{2+}$ in the presence of varying amounts of K_3PO_4 . $[\text{Ru}(\text{phen})_3^{2+}] = 0.005 \text{ mM}$. As evidenced by the straight line with no slope, the K_3PO_4 base does not quench the $\text{Ru}(\text{phen})_3^{2+}$ photocatalyst.

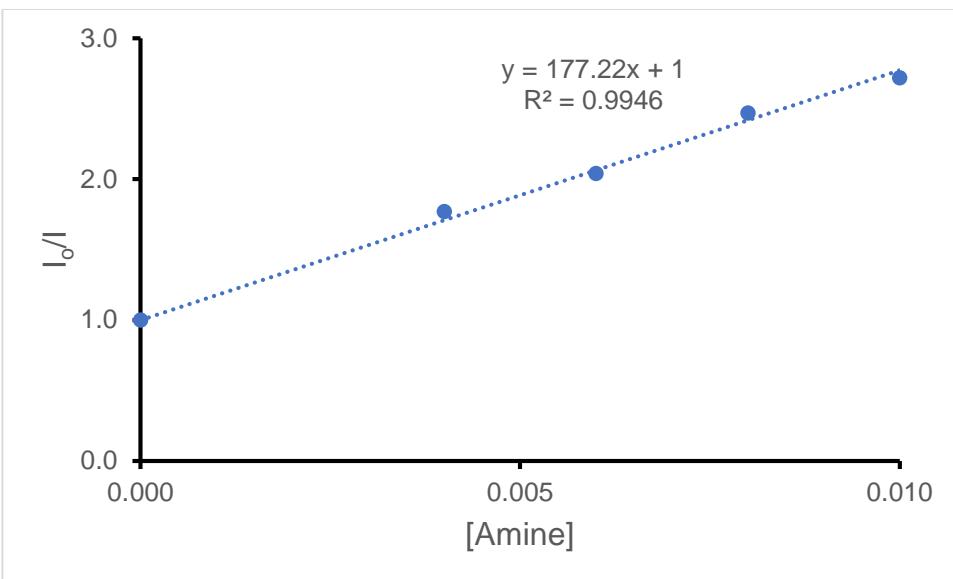

Figure SI-4. Stern-Volmer plot for the fluorescence quenching of $\text{Ru}(\text{phen})_3^{2+}$ in the presence of varying amounts of 4-methoxy-aniline. $[\text{Ru}(\text{phen})_3^{2+}] = 0.005 \text{ mM}$. The aniline substrate clearly quenches the $\text{Ru}(\text{phen})_3^{2+}$ photocatalyst.

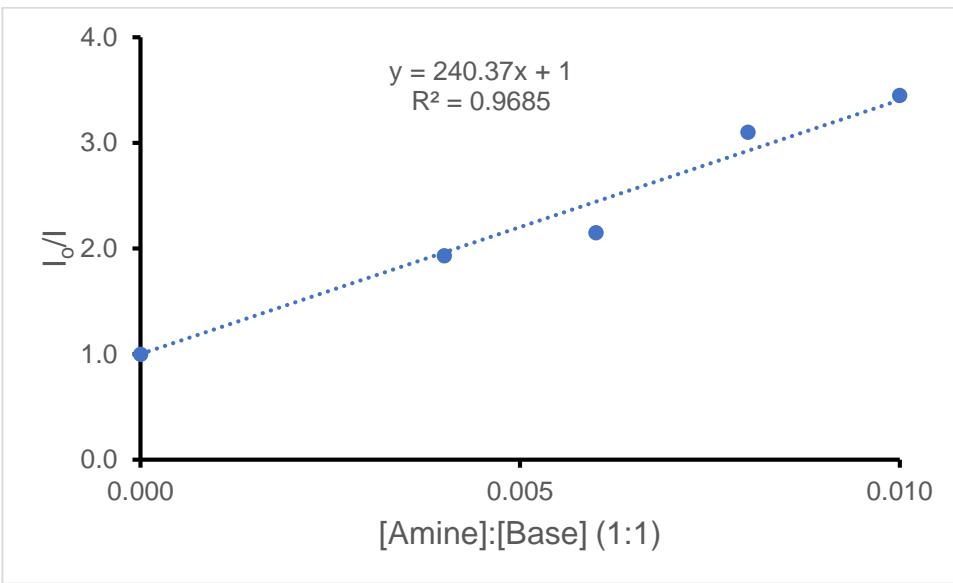

Figure SI-5. Stern-Volmer plot for the fluorescence quenching of $\text{Ru}(\text{phen})_3^{2+}$ in the presence of varying amounts of 4-methoxy-aniline and K_3PO_4 . $[\text{Ru}(\text{phen})_3^{2+}] = 0.005 \text{ mM}$. Addition of base does not have a considerable effect on the fluorescence quenching of $\text{Ru}(\text{phen})_3^{2+}$ by 4-methoxy-aniline.

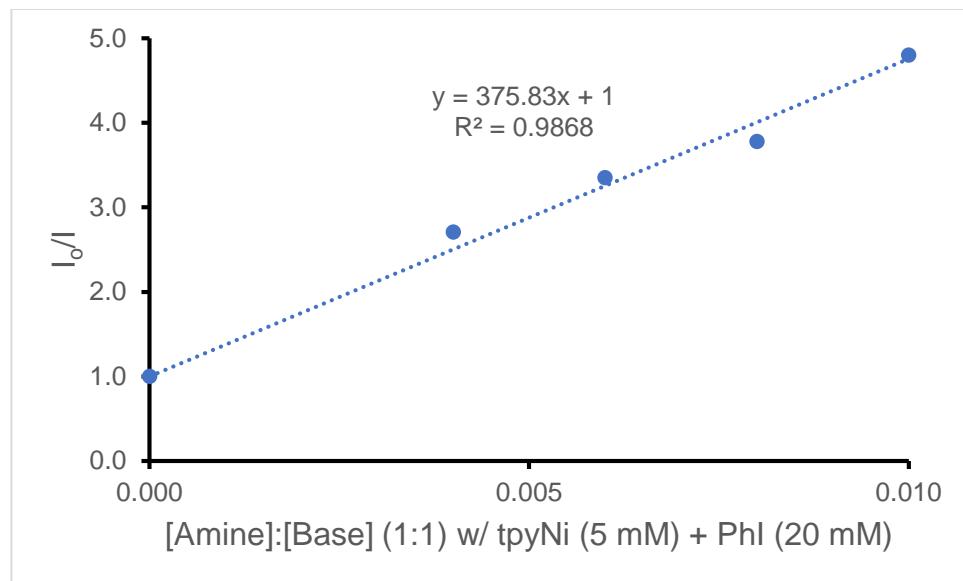

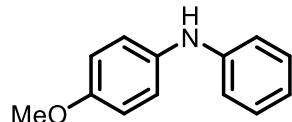

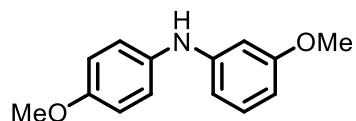

Figure SI-6. Stern-Volmer plot for the fluorescence quenching of $\text{Ru}(\text{phen})_3^{2+}$ in the presence of tpyNi catalyst, iodobenzene, and varying amounts of 4-methoxyaniline and K_3PO_4 . $[\text{Ru}(\text{phen})_3^{2+}] = 0.005 \text{ mM}$. Aniline quenching of the photocatalyst appears to be the dominating quenching mechanism in the entire reaction mixture.
