

## Next: Review tasks

We will show you several commits from a software system and ask you to review them.

It is of utmost importance that you take these reviews seriously.

Like in real life, you should *find as many defects as possible* and you should *spend as little time as possible* on the review. Unlike in real life, we are not interested in maintainability or design issues, but *only in correctness defects* ("bugs"). Examples of defects are code that does not work as intended under all circumstances, code that will lead to unintended exceptions, but also simple typos in messages. A defect can belong to a single part of the code, but it can also be due to the incorrect interaction of several parts of the code.

Please assume that the code compiles but has not been tested very well, if at all.
