With apologies to stick-people everywhere... Any resemblances to actual persons or reality is purely coincidental.

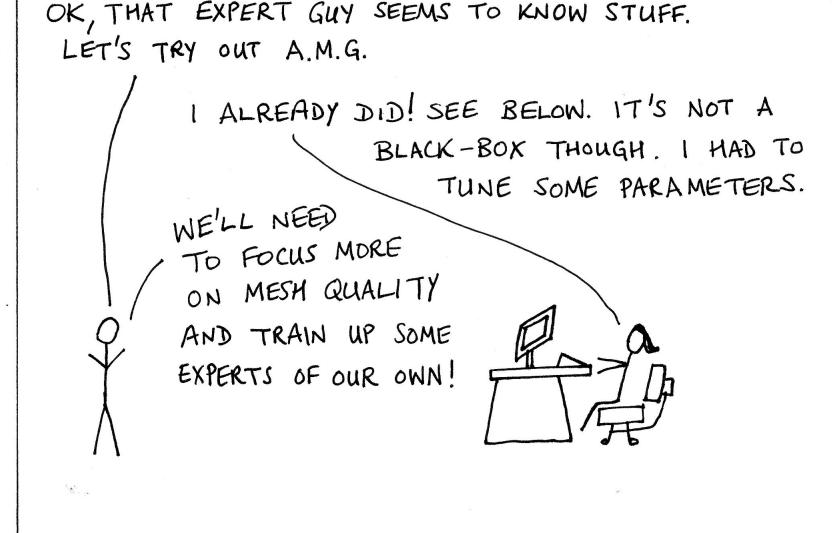

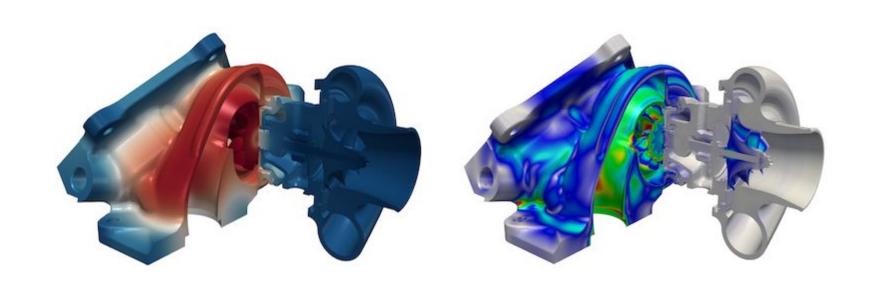

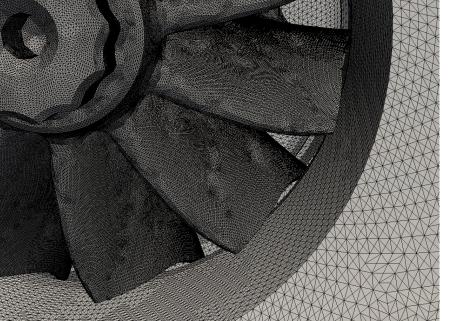

RUN IT (e.g. for 3D ELASTICITY) OK, THAT EXPERT GUY SEEMS TO KNOW STUFF.

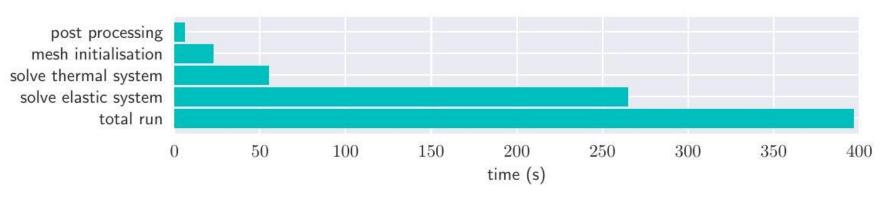

Thermomechanical calculations with AMG using the FEniCS open source finite element package. The mesh has 820,960,256 cells and 163,283,303 vertices. 1,121,793,507 thermal degrees of freedom, and 3,365,380,521 elastic. The simulation was run using 24,576 MPI processes, and the time-to-solution was under 400s.

## "Changing a mindset" by demonstrating:

- ★ A significant (10x, 100x) performance boost. Nobody will change their workflow for a 10-20% improvement.
- ★ Parallel computation alone cannot beat  $O(N^2)$ . We really need O(N) methods.

PROBLEM SIZE N MULTIGRID YOU NEED TO IDEALLY tooN, BUT NEEDS CARE ... THINK ABOUT GEOMETRIC : NEED MESH ON EACH LEVEL USING MULTIGRID. IT'S THE ONLY WAY YOU WILL GET YOUR TIME DOWN ALGEBRAIC: CLASSICAL OR S.A. \_\_\_→ □ A TO SOMETHING A A REASONABLE HARD TO DEBUG? and

★ Work on "real-world" problems. Theoretical gains on well-structured "cubes" often disappear in practice, and will not be believed.

★ Emphasis on building up expertise in new areas, e.g. in this case: mesh quality vs mesh size.

Richardson, C., Sime, N., & Wells, G. (2019). Scalable computation of thermomechanical turbomachinery problems. *Finite Elements in Analysis and Design, 155* 32-42. https://doi.org/10.1016/j.finel.2018.11.002
