

**CENTER FOR REPRODUCIBLE
BIOMEDICAL MODELING**

ABI Wednesday Forum

February 27, 2019

<https://doi.org/10.17608/k6.auckland.7770065>

Four Words that are Causing Problems

1. Replicability
2. Repeatability
3. Reproducibility
4. Reusability

There is a battle going on to decide the meaning of the first three words. Even the US National Academy of Sciences has decided to write a report about it – to be published soon.

Two Extreme Scenarios

1. An experiment is carried out and is done again by the same author, using the same equipment, same methods, basically the same everything.

2. The experiment is carried out by a third-party using different equipment, different methods, etc. Basically, everything is different.

In between these two extremes are variants, For example, a third-party could use the same methods but implement them independently of the original author by reading the description given in the original paper.

What do we mean by reproducibility?

The results of a scientific experiment are **reproducible** if an **independent** investigator accessing published work can replicate them.

The results of a scientific experiment are **repeatable** if the **same** investigator with the same equipment etc. can repeat the results of the experiment.

Some consensus about **Replicability**: Different scientists, same experimental setup; it does not bring much to the table especially for computational experiments.

After some wrangling, Wikipedia is now consistent with these definitions.

These definitions also follow NIST, Six Sigma, ACM and FASEB.

A SIMPLE idea underpins science: “trust, but verify”. Results should always be subject to challenge from experiment. That simple but powerful idea has generated a vast body of knowledge.

Reproducibility of *in silico* experiments

Should be
EASY(IER)!

The results of a scientific experiment are **reproducible** if an **independent** investigator accessing published work can replicate them.

- **Computational repeatability:** a result can be replicated with the same data and software.
- **Algorithmic reproducibility:** a result can be replicated with the same data and different software implementing the same algorithm.
- **Scientific reproducibility:** a result can be replicated with the same data and a different algorithm.
- **Empirical reproducibility:** a result can be replicated with independent data and algorithms.

Stronger Claim

But is it?

BioModels Database

<http://www.ebi.ac.uk/biomodels/>

650 curated models as of June 2018

1013 non-curated models

The screenshot shows the BioModels Database website. The main heading is 'BioModels Database'. Below it, there's a search bar and navigation links. The featured model is 'Improved guinea-pig ventricular cell model incorporating a diadic space, IKr and IKs, and length- and tension-dependent processes'. A schematic diagram of the cell model is shown at the bottom, illustrating the flow of current across the cell membrane.

Browse Models

The following fields are used to describe a model:

- BioModels ID** → A unique string of characters associated with the model, which will never be re-used even if the model is deleted from the BioModels Database.
- Name** → The name of the model, as written in the model itself by its creator(s).
- Publication ID** → The unique identifier of the reference publication describing the model, specified either as a [NCBI public bibliographic database](#) identifier, or as a [DOI](#), or as a URL. Being all published, all models must have one publication identifier, and the same identifier can be shared amongst several models if they have been described in the same publication.
- Last Modified** → The date when the model was last modified.

To view a model, simply click on the correspondent BioModels ID provided within the leftmost column of the row corresponding to the model.

BIOMD0000000005 Huang1990_MAPK_unirasens

BIOMD0000000010 Kholodenko2000_MAPK_feedback

Over 90% of models could not be reproduced on initial attempt based on published information

Incomplete parameters

Executing Code != Computational Experiment

Why not use an executable language such as Matlab, Python, Java etc to exchange and reproduce models?

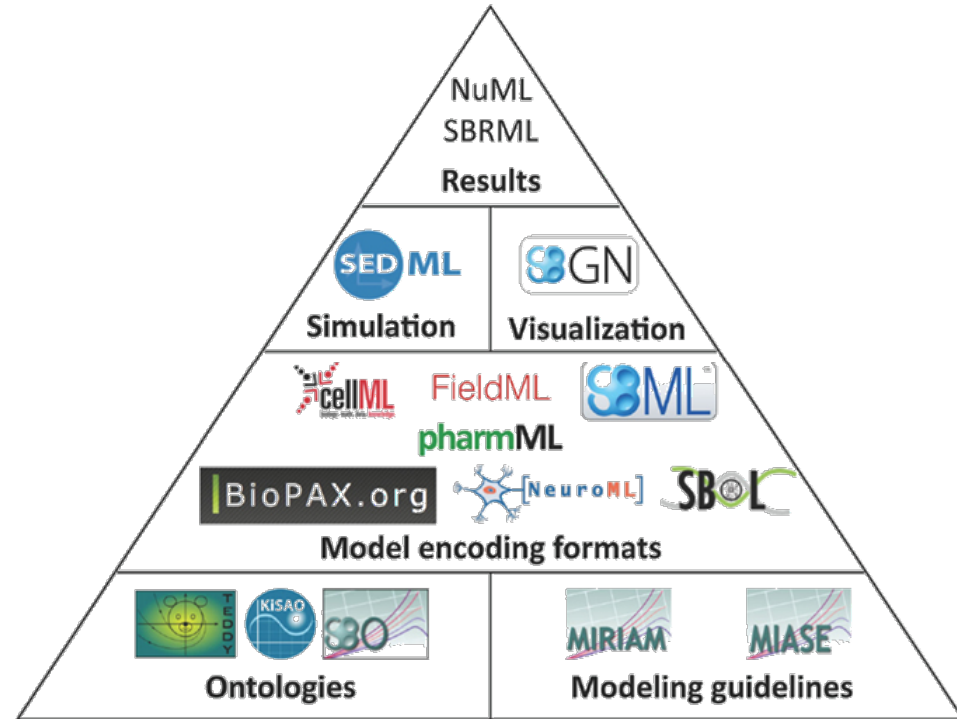

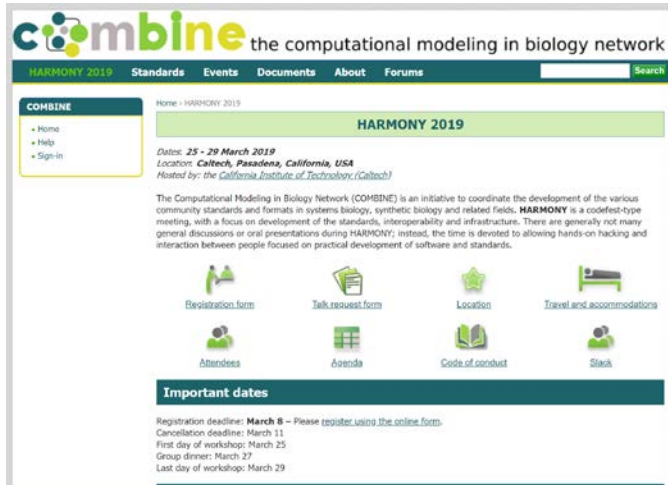

Recall that **reproducibility** requires the experiment be recreated independently. An executable language is really only good for **repeatability**.

1. To reproduce a model in a different programming language it would need to be manually translated to another language. This can be difficult and error prone.
2. There is no means to share such models because other groups might use different programming languages, APIs, etc.
3. *Combining such models into larger models is extremely difficult.*
4. *It is difficult to annotate models that use an executable language.*

What's the solution?

There is no complete solution but many of the issues can be resolved by using community based modelling standards.

These standards fall under the umbrella of the COMBINE Standards (<http://co.mbine.org/>)

Many pieces exist, but...

combine the computational modeling in biology network

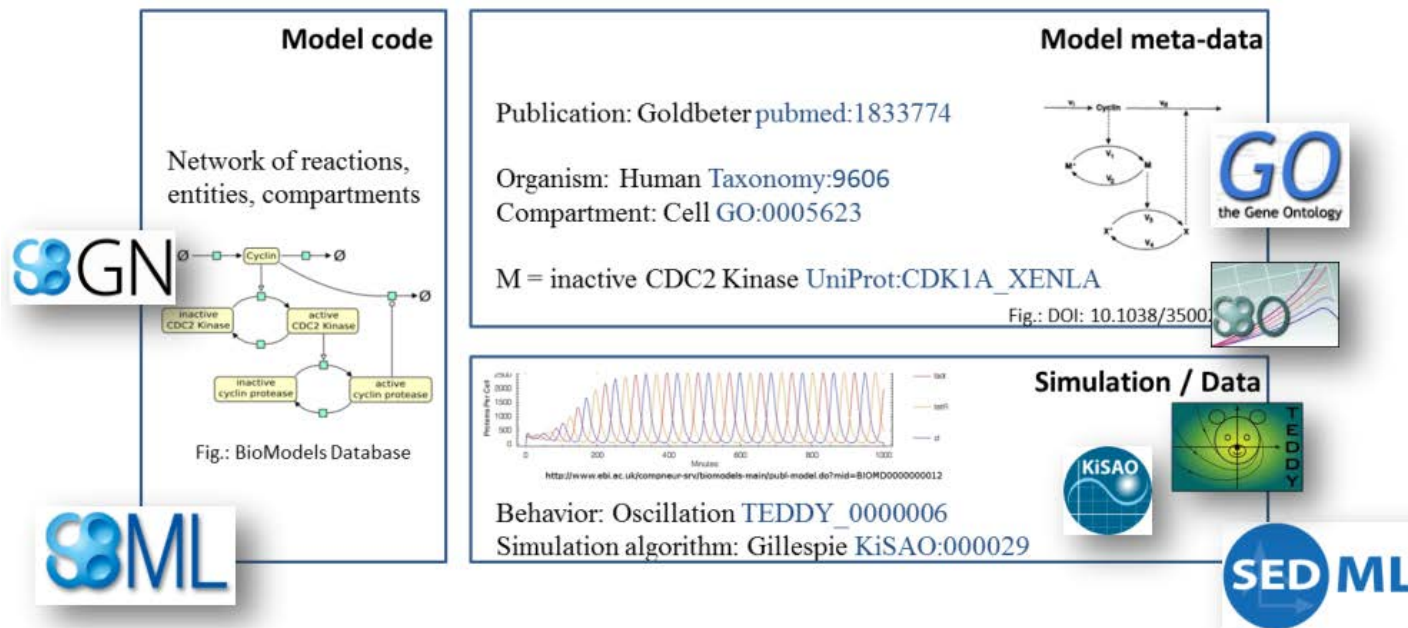

Figure from
Dagmar
Waltemath

Improved guinea-pig ventricular cell model incorporating a diadic space, IKr and IKs, and length- and tension-dependent processes (Basic Model)

Improved guinea-pig ventricular cell model incorporating a diadic space, IKr and IKs, and length- and tension-dependent processes.

Model Status

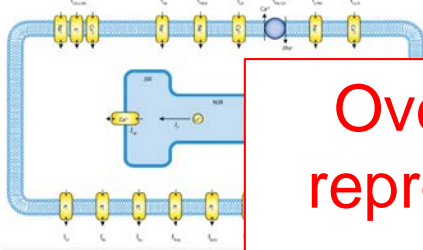

This version has been curated and unit checked by Penny Noble and is known to run into COR and PCOR. This variant is parameterised for the BASIC model, excluding acid/cytosolic dependent modulation and electromechanical processes. This model is also associated with a PCOR session file.

Model Structure

ABSTRACT: The guinea-pig ventricular cell model, originally developed by Noble et al in 1991, has been greatly extended to include accumulation and depletion of calcium in a diadic space between the sarcolemma and the sarcoplasmic reticulum where, according to contemporary understanding, the majority of calcium-induced calcium release is triggered. The calcium in this space is also assumed to play the major role in calcium-induced inactivation of the calcium current. Delayed potassium current equations have been developed to include the rapid (IKr) and slow (IKs) components of the delayed rectifier current based on the data of Hinch and Tazawa, along with data from Sangpetit and Surinkeewit. Length- and tension-dependent changes in mechanical and electrophysiological processes have been incorporated as described recently by Kohl et al. Drug receptor interactions have started to be developed, using the sodium channel as the first target. The new model has been tested against experimental data on action potential clamp, and on force-interval and duration-interval relations: it has been found to reliably reproduce experimental observations.

The original paper reference is cited below:

Improved guinea-pig ventricular cell model incorporating a diadic space, IKr and IKs, and length- and tension-dependent processes, Denis Noble, Anthony Varughese, Peter Kohl and Fenella Noble, 1999, Can J Cardiol, 14, 122-134. PubMed ID: 9437234

Goals

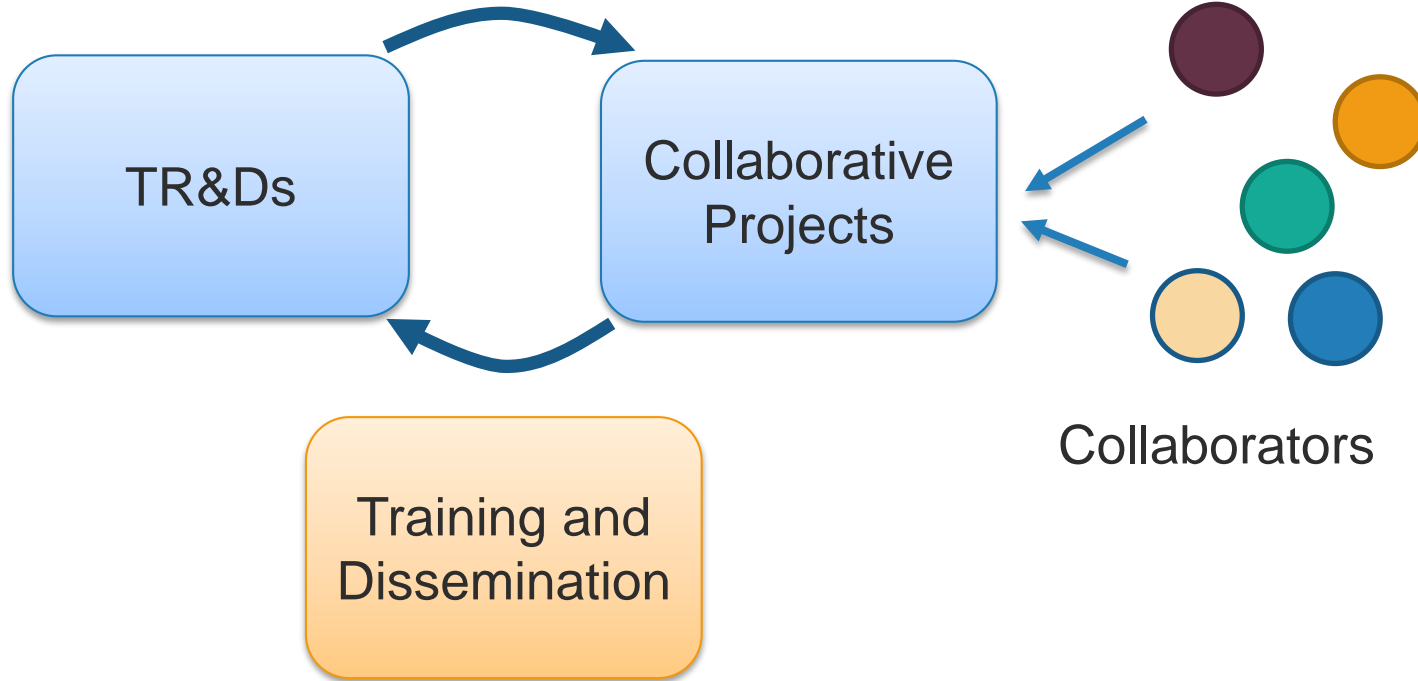

Long-term

- Enable more comprehensive and more predictive models that advance precision medicine and synthetic biology

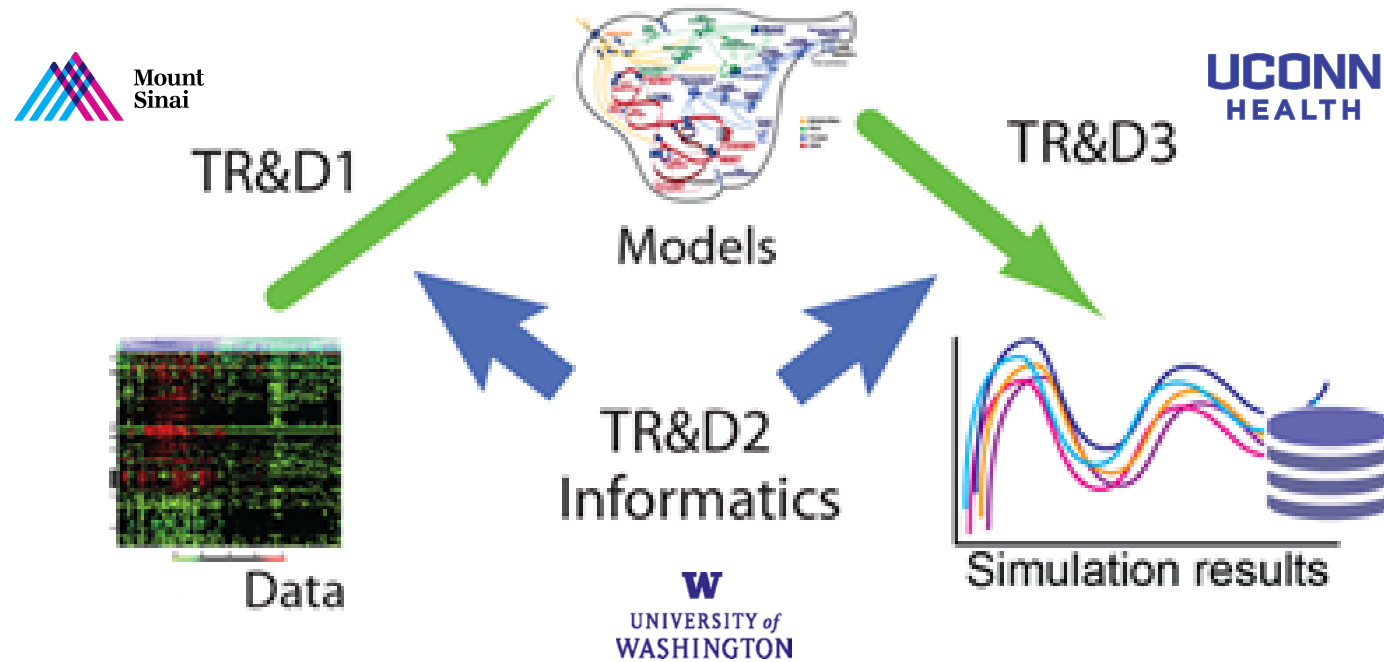

Short-term

- Make modeling more reproducible, comprehensible, reusable, composable, collaborative, and scalable
- Develop technological solutions to the barriers to modeling
- Integrate the technology into user-friendly solutions
- Push researchers to use these tools
- Partner with journals

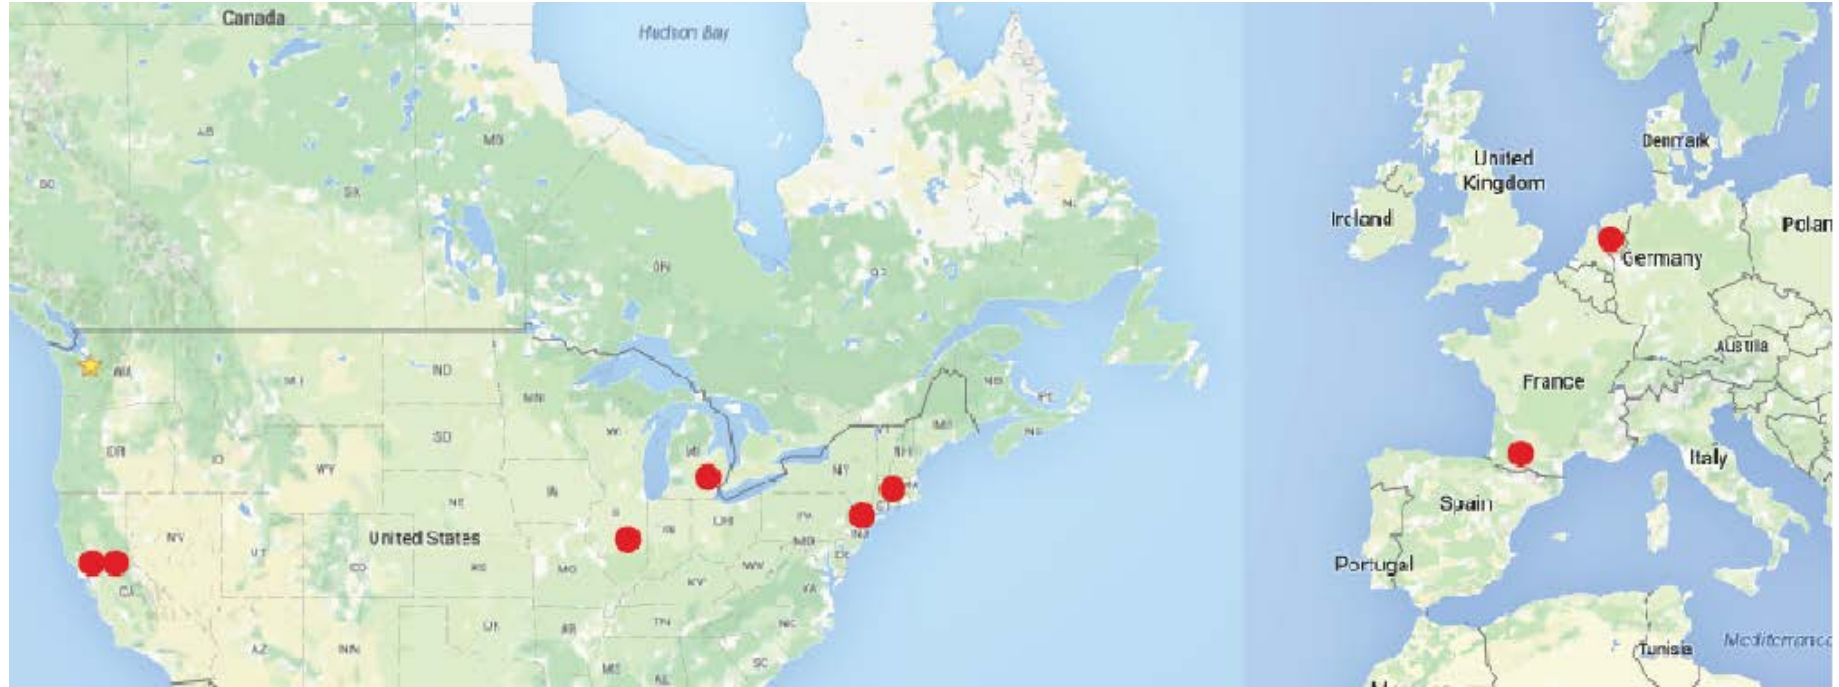

Center organization

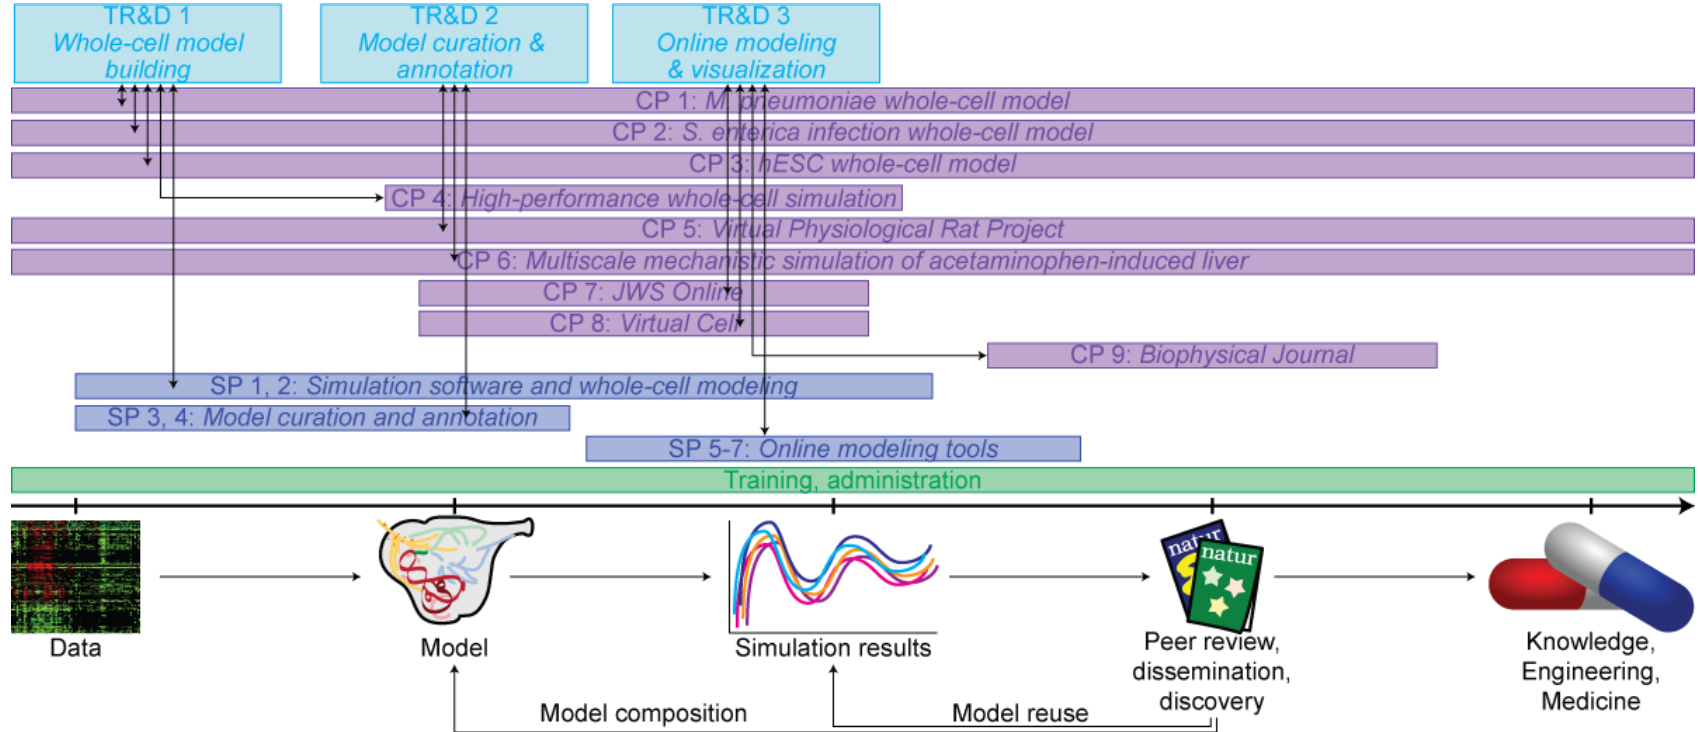

TR&Ds

Driving collaborative projects

TR&Ds span every modeling phase

Training and dissemination

Center funding

- \$6.5 million for 5 years
- Each core has R01-scale funding
- Funds for workshops
- Funds for project management

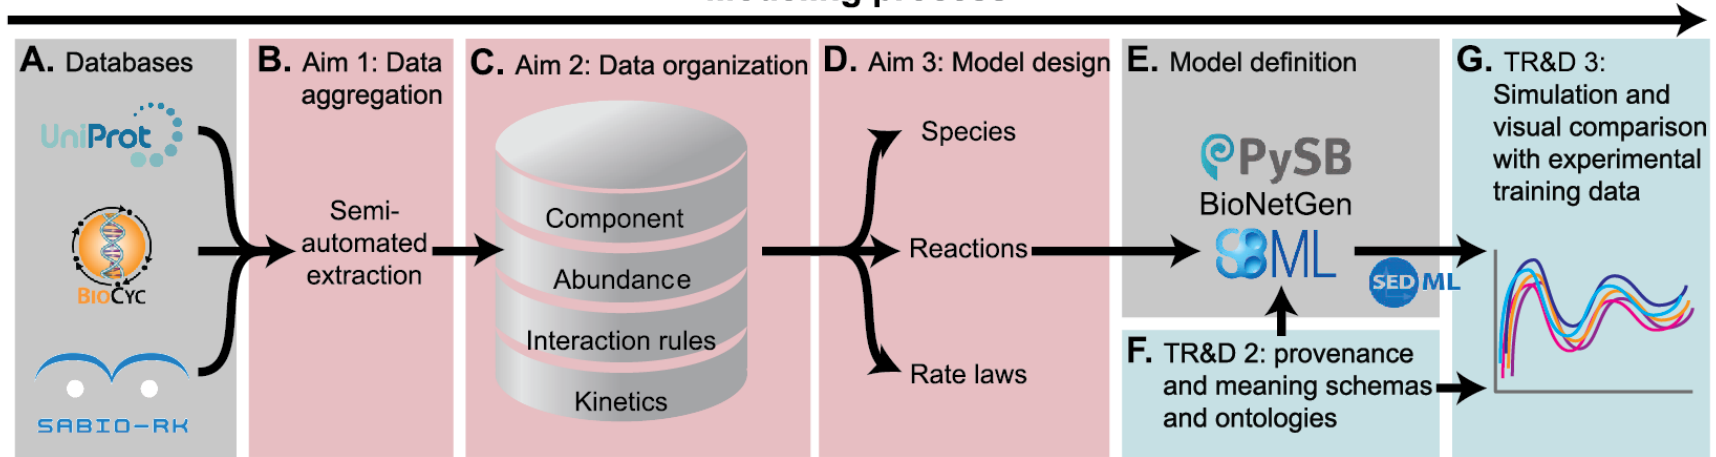

TR&D 1: Scalable model construction

TR&D 1: Model Construction

Modeling process

TR&D 1 will develop tools for reproducibly building models. This will include (1) aggregating large and heterogeneous data needed to build models, (2) organizing this data for model construction, and (3) designing models from this data.

TR&D 1: goals

- Facilitate the construction of more comprehensive and more accurate models
 - CP 1: *Mycoplasma pneumoniae*
 - CP 3: Human embryonic stem cells

TR&D 1: goals

- Overcome the most immediate barriers
 - Lack of data for modeling
 - Inability to identify relevant data for modeling
 - Disconnect between data and models
 - Incomposability of separately developed models
 - Insufficient metadata for composition
 - Inability to model collaboratively

TR&D 1: philosophy

- Modeling should be collaborative and composable from the ground up
- Modeling tools should be modular, composable, and easy to use
- Technology development should be motivated by specific models

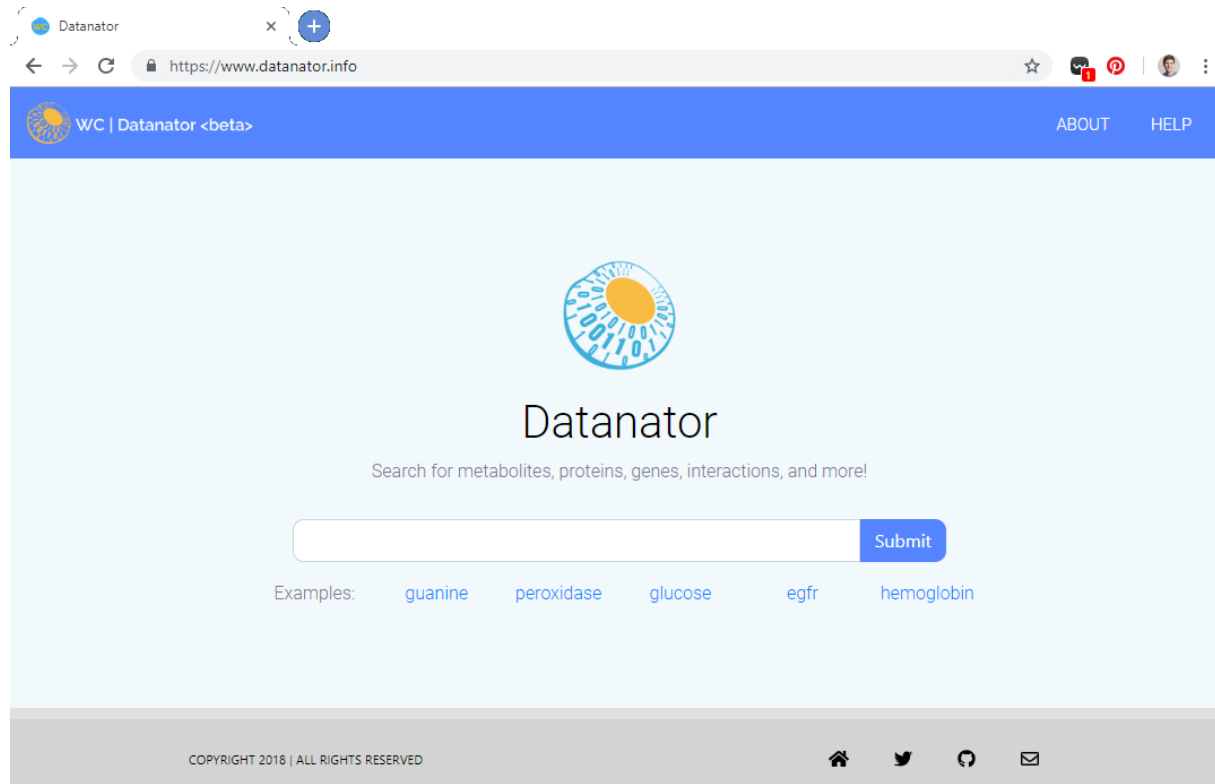

TR&D 1: aims

- Develop an integrated database of data for modeling
- Develop tools for identifying relevant data for a specific model
- Develop a framework for organizing the data needed for a model
- Develop a framework for programmatically constructing models from these datasets
- Deploy these tools as web-based tools and Python libraries

TR&D 1: progress

- Developed an integrated database of most essential data
- Developed tools to discover relevant data about a specific organism and condition
- Begun to develop web interface to browse and search data
- Developing tools for extracting data for a specific model
- Developing a data model to describe the data used for specific modeling projects
- Developing a framework for programmatically constructing models from these datasets

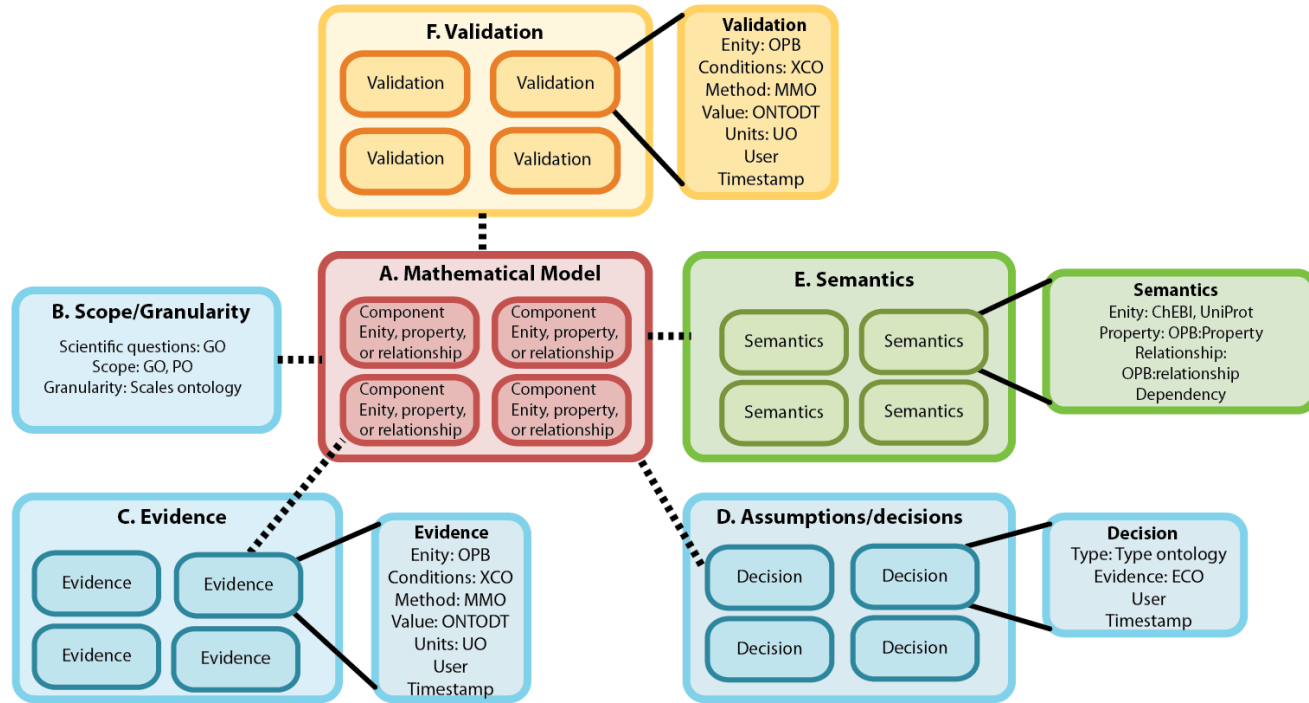

Datanator website

TR&D 2: Enhanced semantic and provenance annotation to facilitate scalable modeling

TR&D 2: Informatics Support

TR&D 2 will develop tools for annotating the meaning and provenance of models as well as annotating simulation results, model behavior and model validation. This will include developing the schema and ontologies for describing the provenance, simulation data and validation.

TR&D 2: Goals

Improved semantic annotation

- Ontology-based composite annotations
- Tools that support common annotation formats (COMBINE Archives)
- Annotation that describes model provenance & modeling assumptions
- Annotation that can describe data as well as models

Tools that use these annotations

- Semantic search for relevant models
- Automatic data-to-model matching
- Model merging, model visualization, model modularization

TR&D 2: progress

Completion of Java API for annotation

- Available with release 4.2 of the SemGen software (Dec '18)
- Read/write of COMBINE Archive format

Proof-of-concept demonstration of annotation API

- With Antimony/Tellurium: Kyle Medley
- Begun communication with Alan Garny for use by OpenCOR

Meetings with Auckland team

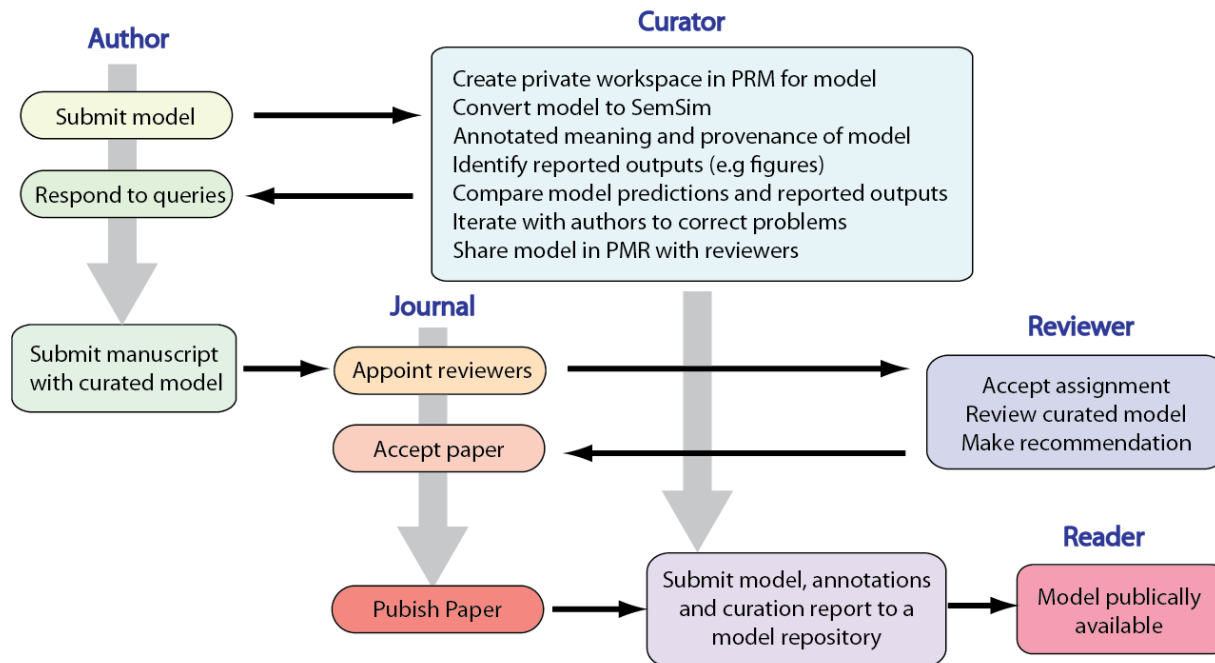

- Train and coordinate annotation efforts

Model curation service to enhance model reuse and composition

Curation service: goals

Manuscripts received by journals will be curated to make sure that any author supplied code will faithfully reproduce the results presented in the manuscript.

Curation service: journal pilots

- Physiome: agreed
- Biophysical Journal: agreed
- Mathematical Biosciences: agreed
- Bulletin of Mathematical Biology: agreed
- BMC Systems Biology: journal closing down!
- PLoS Computational Biology: agreed
- Molecular Systems Biology: potential
- Cell Systems: declined
- Other suggestions?

Curation service: in practice

Anand Rampadarath
mathematician!

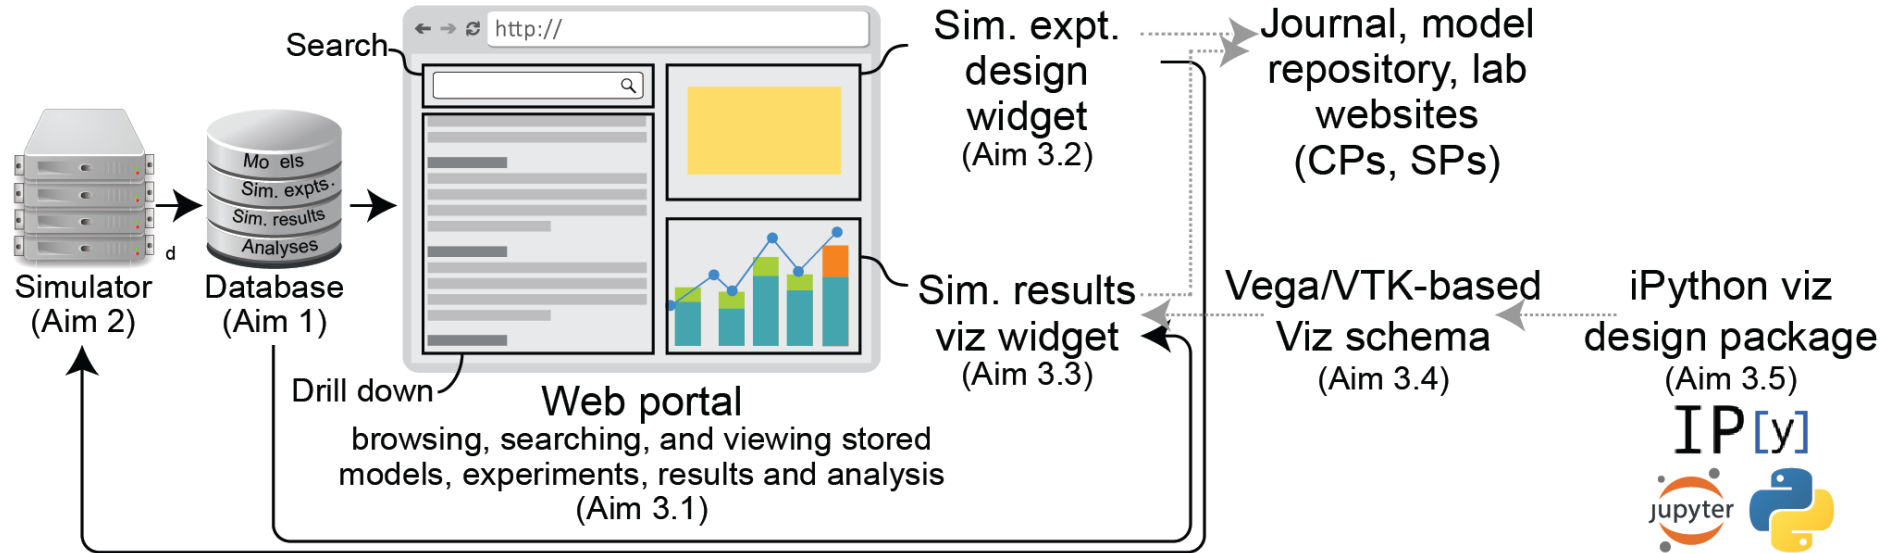

Karin Lundengård
biologist!

TR&D 3: Online scalable simulation, analysis, and visualization

TR&D 3: Simulation

Note: We do not intend to write new simulators. We will use existing third-party simulation software.

TR&D 3 will develop tools for reproducibly simulating and analyzing models online. This will include (1) web-based tools for designing simulation experiments and visualizing simulation results, (2) a universal simulator for simulating biomodels and (3) a database for organizing and storing simulation results.

TR&D 3: progress

- Simulation: Infrastructure Design
 - Databases:
 - PostgreSQL database for models, data, simulation, provenance.
 - MongoDB for noSQL (logging information)
 - RESTful API servers:
 - Separate servers with different access permissions and features
 - Different classes of API (data, solver, execution)
 - Registry of solvers:
 - Algorithm capabilities
 - Task capabilities
 - Container infrastructure:
 - Container registry – Docker
 - Container orchestration – Kubernetes (seven Virtual Machines)
 - Job manager (+ own database + API)
 - Slurm/XMod workload manager – job, *not* workflow manager
 - Compute and storage resources
 - Local: dedicated partition on cluster, HDF5 storage
 - AWS (overhead involved, adds to cost; needed for portability)
- Standards: Language and Tool Development
 - Python support for SBML render and layout extensions
 - New high-level, human-readable API for SED-ML

Technology integration

Testing and documentation

Encourage a more systematic approach to modeling, treating modeling more as an engineering discipline especially when developing larger models.

But even for small models where there are clinical implications, the following broad desirable attributes should be considered:

- a) Documentation (TR&D 1, 2, 3)
- b) Uncertainty Quantification (TR&D 3)
- c) Reusable (TR&D 1, 2)
- d) Exchangeable (TR&D 1, 2)
- e) Stress-Tested (TR&D 3)

This dovetails with existing efforts such as the Credible Practice of Modeling & Simulation in Healthcare at IMAG who have the Ten Simple Rules.

13th International CellML Workshop

The 13th International CellML Workshop will be held 6 & 7 May 2019 at the Goldie Estate on Waiheke Island, Auckland, New Zealand.

The annual International CellML Workshop is an opportunity for scientists to present and discuss ongoing work related to physiological modelling and simulation with particular focus on model and data exchange & reuse, archiving, and versioning and related software support.

While the primary emphasis of this workshop is on CellML and related technologies, work from across the VPH & Physiome Project and computational systems biology communities are covered (e.g., SED-ML, Physiome Repository, COMBINE, reproducibility and model curation, etc.). In addition to participants from the Auckland Bioengineering Institute, the Medical Technologies Centre of Research Excellence, the Maurice Wilkins Centre, and the University of Auckland, previous workshops have attracted delegates from the UK, USA, Japan, Norway, France, Poland, Belgium, Italy, and Germany for both in-person and remote presentations.

This year the workshop will feature the following topics.

- libCellML developments and plans (documentation; GitHub).
- SPARC MAPcore.
- Model curation.
- Model and data annotation.

Location

The 13th International CellML Workshop will be held at the Goldie Estate, Waiheke Island, Auckland, New Zealand. Daily transport from downtown Auckland to the venue will be arranged each day of the workshop.

Programme

A preliminary programme will be forthcoming. Please note that the actual schedule is subject to change.
