

Contemporary Peer Code Review Practices in Research Software

Jeffrey C. Carver
University of Alabama

```
1 // file: IVR.CPP
2 void IVR()
3 {
4     //press 1 for account balance, 2 for last transaction,
5     //3 for last statement, any other for operator
6     play_prompt();
7
8     int key_pressed= get_user_choice();
9     if(key_pressed ==1)
10    {
11        play_account_balance();
12    }
13    else if(key_pressed =2)
14    {
15        play_last_transaction();
16    }
17    else if(key_pressed ==3)
18    {
19        play_last_statement();
20    }
21    else transfer_to_operator();
22 }
```

Assignment operator
instead of comparison

```
1 //file: printer.java
2 if (user.isAuthenticated)
3 {
4     userAccess = checkUserAuthorization(user);
5
6     //if user has access to printer
7     if(user.isAuthenticated && userAccess.printer)
8         printUsageReport ();
9     else
10         emailUsageReport ();
11 }
```

Do you think only novice
developers make those
mistakes?

```
#define CDMA_SUBSCRIPTION_SOURCE_NV 0
#define CDMA_SUBSCRIPTION_SOURCE_RUIM 1
```

Isn't '&& noMedia' redundant? noMedia can only be true inside the if block.

```
if ((nbytes=recvfrom(fd,msgbuf,MSGBUFSIZE,0,  
                    (struct sockaddr *) &addr,&  
63 »                perror("recvfrom");  
64 »                exit(1);  
65 »            }  
66 »            puts(msgbuf);
```

~~David Johnson~~

Feb 8, 2010

Isn't there a risk of msgbuf not being terminated? Reading all the way to MSGBUFSIZE seems to risk overwriting the implicit init done, or does the kernel always null-terminate the buffer, even if it is larger than MSGBUFSIZE?

I guess the worst case scenario is puts going off on a tangent, so probably not particularly dangerous, but still?

~~David Johnson~~

Feb 9, 2010

You are absolutely right. I will change it to write() the number of bytes received. I only tested it with the other file (sender.c) which sends "Hello, world" with the null-byte attached. I will send a patch when I get home. Thanks for the review!

```
54 »      »      if ( $this->isPermalink ) {  
55 »      »      »      $html .= Linker::link(  
56 »      »      »      »      »      »      SpecialPage::getTitleFor( 'ArticleFeedbackv5', $record[0]->p  
age_title ),  
57 »      »      »      »      »      »      wfMessage( 'articlefeedbackv5-special-goback' )->text());
```

Catrope

Apr 17, 2012

And this unfixes a security bug that was fixed earlier: this must be ->escaped(), not ->text(), because the second param to link() is HTML.

You might be an Internet 'solopreneur', a lone wolf who writes, edits, formats, checks and publishes your own content. Or you might work for a ~~company~~ website, either as a content creator or as a ~~production~~ editor, sub-editor or ~~editor~~ - the person in charge of quality control and tasked to edit/proofread work produced by your colleagues.

Not you? Maybe you want to self-publish a book on Amazon, check through a student essay or thesis, perhaps error-check a company report? Maybe you're involved in creating a brochure, newsletters, business cards, product packaging or signs? Not you either? What about sending an email, posting a Tweet or updating Facebook? They all involve words. Is everything you've typed recently correct? Are you certain?

It's not always easy to spot errors.

You might not have a proofreading process. Or you might be already be actively proofreading and want to get better at it.

possibly

And forgotten

If you publish or print words of any kind, you won't want any mistakes to slip through. You want to ensure that what you produce is the best that it can be. This is especially true if you are printing anything. Mistakes on the web can be corrected. You don't have that luxury with print. Print has permanency. Just think how you'd feel if you'd been the sign writer who painted 'SHCOOL' in big white letters on the road when you meant to spell 'SCHOOL'. Or that you'd given the OK to a sign that read 'DRIVE-THRU ENTERANCE'. These are real examples. You'll find more proofreading howlers like these later in this book.

Again, proofreading is an essential part of the publishing process. The larger the font, the more you should check it. The more permanent the publication or installation, the more you should check it. You should check and re-check everything you plan to publish until your eyes ache or until the words start to look incorrect and you have to look them up again just to make sure that you're not going crazy. And if you have time for a re-re-check, so much the better.

A brass balance scale is shown, partially open, revealing two pans. The left pan is lower and contains several coins. The right pan is higher and is empty. The scale is made of brass and has a wooden frame. The background is black.

Code Review Comment Exercise

“You are writing cryptic code”

**“Its hard for me to grasp what is
going on in the code”**

Use I-Messages

**“This is not how I would have solved
the problem”**

**“Why did you use this approach rather
than approach X?”**

Ask questions where possible

**“You are sloppy when it comes to
writing tests”**

**“I believe that you should pay more
attention to writing tests”**

**Criticize the author's behavior,
not the author**

**“You’re requesting the serve
multiple times, which is inefficient”**

**“This code is requesting the service
multiple times, which is inefficient”**

Talk about the code, not the coder

“I always use fixed timestamps in tests and you should too”

“I would always use fixed timestamps in tests for better reproducibility, but in this simple test, using the current timestamp is also ok”

Accept different solutions

A group of military personnel in camouflage uniforms are gathered around a whiteboard, engaged in a collaborative activity. One person is writing on the board, while others observe. The whiteboard contains handwritten notes, including "Issues Identified code review" and "Wifi Password".

From [REDACTED]
Subject [patch] Fix cross-user symlink race condition vulnerability
Date Wed, 31 Oct 2012 04:46:47 GMT

There is a race condition vulnerability in httpd 2.2.23 (also present in previous releases) that allows a malicious user to serve arbitrary files from nearly anywhere on a server that isn't protected by strict os level permissions. In a shared hosting environment, this is a big vulnerability.

If you would like more information on the exploit itself, please let me know. I have a proof of concept that is able to hit the exploit with 100% success.

This is my first patch submitted to Apache, so I'm sorry if I've missed something. I'm aware that this doesn't meet some of the code standards that are in place (e.g, it doesn't work at all on Windows), but I wanted to put it out there anyway.

The patch that fixes the vulnerability is attached. Thank you in advance for the feedback.
