Antoine-Laurent de Lavoisier (also **Antoine Lavoisier** after the **French Revolution**; French: [ɑ̃twan lɔvɛ̃ ðə lavwazje]; 26 August 1743 – 8 May 1794)^[1] was a French nobleman and chemist who was central to the 18th-century **chemical revolution** and who had a large influence on both the **history of chemistry** and the **history of biology**.^[2] He is widely considered in popular literature as the "father of modern chemistry".^{[3][4]}

It is generally accepted that Lavoisier's great accomplishments in chemistry largely stem from his changing the science from a qualitative to a quantitative one. Lavoisier is most noted for his discovery of the role **oxygen** plays in **combustion**. He recognized and named **oxygen** (1778) and **hydrogen** (1783) and opposed the **phlogiston theory**. Lavoisier helped construct the **metric system**, wrote the first extensive **list of elements**, and helped to reform **chemical nomenclature**. He predicted the existence of **silicon** (1787)^[5] and was also the first to establish that **sulfur** was an element (1777) rather than a compound.^[6] He discovered that, although matter may change its form or shape, **its mass always remains the same**.

Lavoisier was a powerful member of a number of **aristocratic** councils, and an administrator of the **Ferme générale**. The **Ferme générale** was one of the most hated components of the **Ancien Régime** because of the profits it took at the expense of the state, the secrecy of the terms of its contracts, and the violence of its armed agents.^[7] All of these political and economic activities enabled him to fund his scientific research. At the height of the **French Revolution**, he was charged with tax fraud and selling adulterated **tobacco**, and was **guillotined**.

Wikidata and Scholia as a hub linking chemical knowledge

Egon Willighagen^A, Denise Slenter^A, Daniel Mietchen^B, Chris Evelo^{A,C}, Finn Nielsen^D

Introduction

Making chemical databases more FAIR (findable, accessible, interoperable, and reusable) benefits computational chemistry and cheminformatics. We here discuss Wikidata, a young sister project of Wikipedia, with one key difference: it is a machine readable database, making it far more useful for interoperability of molecular databases in systems biology [1,2]. Thanks to the WikiProject Chemistry community on Wikidata, there is a growing amount of information about chemical compounds.

Methods

Scholia is a Python/Flask-based server system that creates webpages using a template approach [5]. It defines templates for concepts around knowledge exchange, such as publications, journals, publishers, but also topics. It uses SPARQL queries against the Wikidata Query Service (WDQS, query.wikidata.org) and visualizes the data in various forms. Furthermore, we used a combination of Bioclipse (bioclipse.net) and QuickStatements to add missing chemical compounds for biological pathways from WikiPathways [6]. Where needed, new Wikidata properties were proposed.

Results

We here introduce our contributions to the WikiProject Chemistry to support FAIR-ification of open chemical knowledge. For example, we proposed new Wikidata properties to annotate compounds with external database identifiers for the EPA CompTox Dashboard [3], the SPLASH [4], and MetaboLights. We also introduced a Scholia extension [5], visualizing data about chemicals and chemical classes:
