Supplementary figure 1. Beanplots depicting distribution of normalized expression of nanoString PanCancer Immune gene panel – acute response in lung (experiments 1 and 2). Samples are named by dosing regimen (Acute.1x, single instillation; Acute.4x, four weekly instillations) and sample numbers, for which 1-8 correspond to vehicle controls (VEH) and numbers 9-16 correspond to cSiO₂-exposed mice. Red lines show the medians, white/black lines represent individual data points (line width indicates number of genes at that expression level), and blue polygons represent the estimated density of the data. The shaded region indicates genes excluded because of low signal. Plots were generated using BoxPlotR (shiny.chemgrid.org/boxplotr/).

Supplementary figure 2. Beanplots depicting distribution of normalized expression of nanoString PanCancer Immune gene panel – chronic response in lung (experiment 3). Samples are named by “tissue.cohort.ID”. Cohorts 1, 2, 3, and 4 correspond to samples obtained 1, 5, 9, or 13 weeks post instillation with cSiO_2 . Sample ID numbers 1-8 correspond to vehicle controls (VEH), and numbers 9-16 correspond to cSiO_2 -exposed mice. Red lines show the medians, white/black lines represent individual data points (line width indicates number of genes at that expression level), and blue polygons represent the estimated density of the data. The shaded region indicates genes excluded because of low signal. Plots were generated using BoxPlotR (shiny.chemgrid.org/boxplotr/).

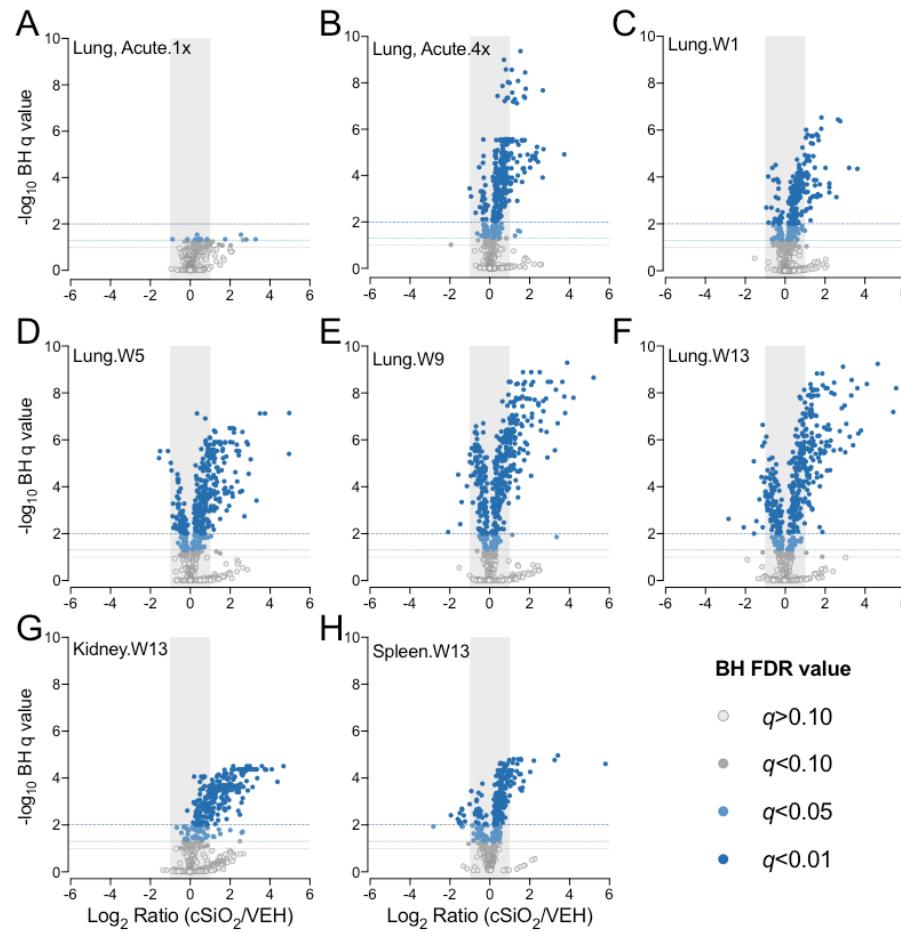

Supplementary figure 3. Beanplots depicting distribution of normalized expression of nanoString PanCancer Immune gene panel – chronic response in kidney and spleen. Samples are named by tissue (kidney or spleen) and sample numbers, for which 1-8 correspond to vehicle controls (VEH) and numbers 9-16 correspond to cSiO_2 -exposed mice. Red lines show the medians, white/black lines represent individual data points (line width indicates number of genes at that expression level), and blue polygons represent the estimated density of the data. The shaded region indicates genes excluded because of low signal. Plots were generated using BoxPlotR (shiny.chemgrid.org/boxplotr/).

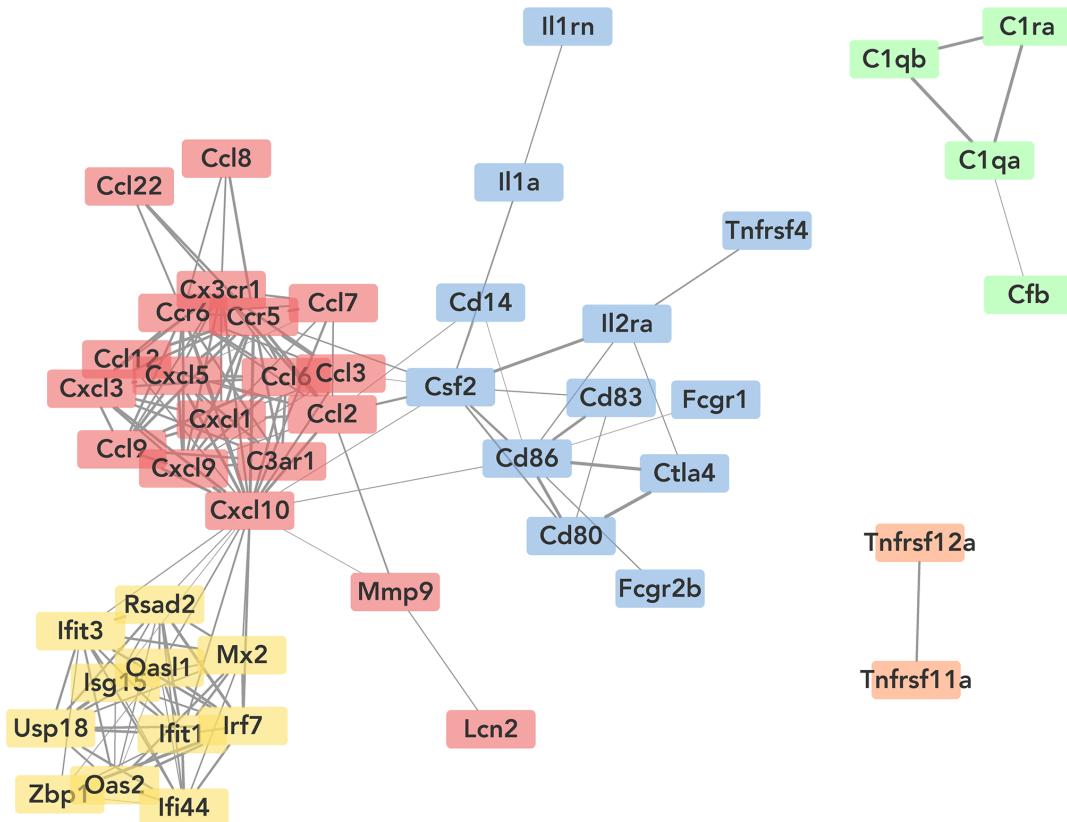

Supplementary figure 4. Process flow for differential gene expression analysis using nSolver. As outlined by the supplied user manual¹, the mean of the gene across all samples was compared against the threshold, which is set as 10 times the background signal. If the gene mean was below the threshold, the mixture negative binomial (*MLE* function in R, Wald test to calculate a *p* value) was applied; if model 1 did not converge, the simplified model in 2 (*glm.nb* function in R/Mass) was applied instead. If the gene mean was above the threshold, the mixture model in 1 was simplified to model 2. If model 2 did not converge, the log-linear model 3 was used (*lm* function in R). For each gene, the optimal model applied for each gene is provided in Supplementary File 2 (model 1, “Wald”; model 2, “*lm.nb*”; model 3, “*loglinear*”).

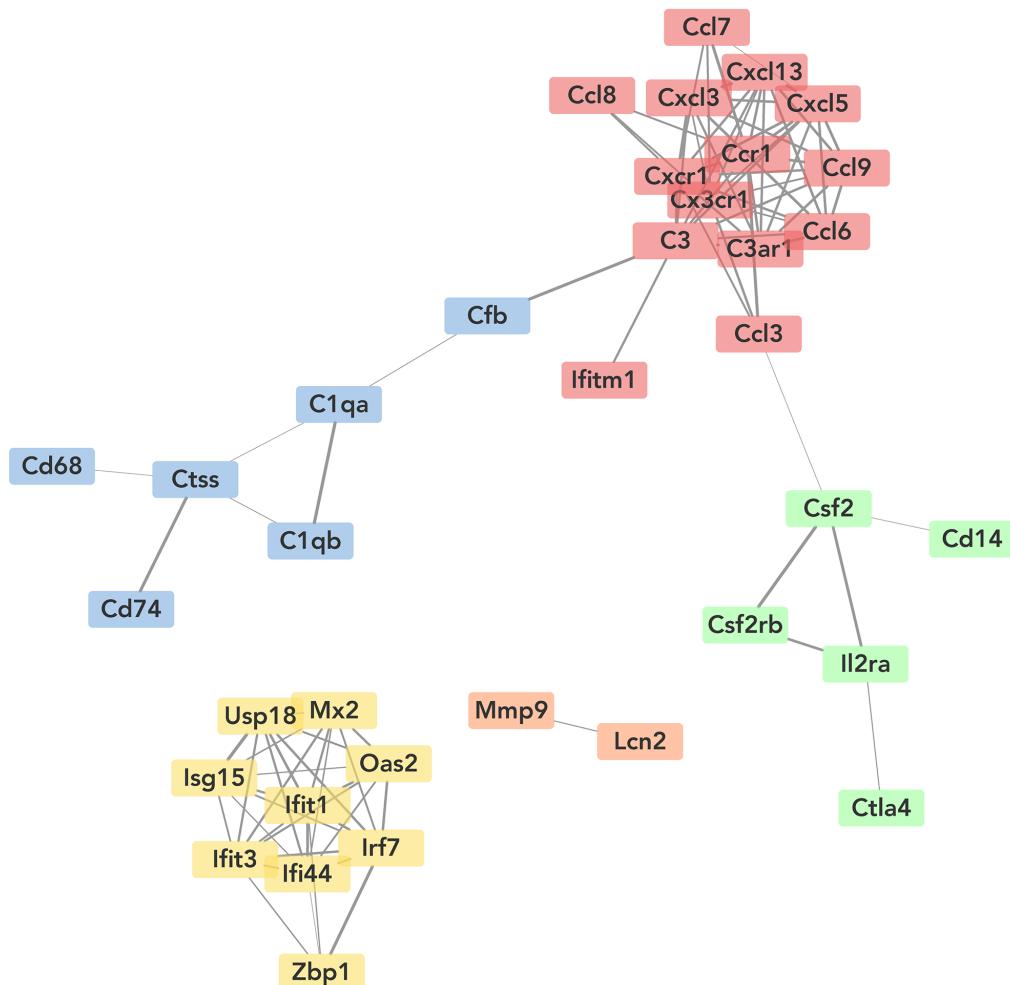

¹ NanoString Technologies, Inc. (2018) nCounter Advanced Analysis 2.0 Plugin for nSolver Software User Manual, vers. Jan 2018 (MAN-10030-03). Accessed at www.nanostring.com

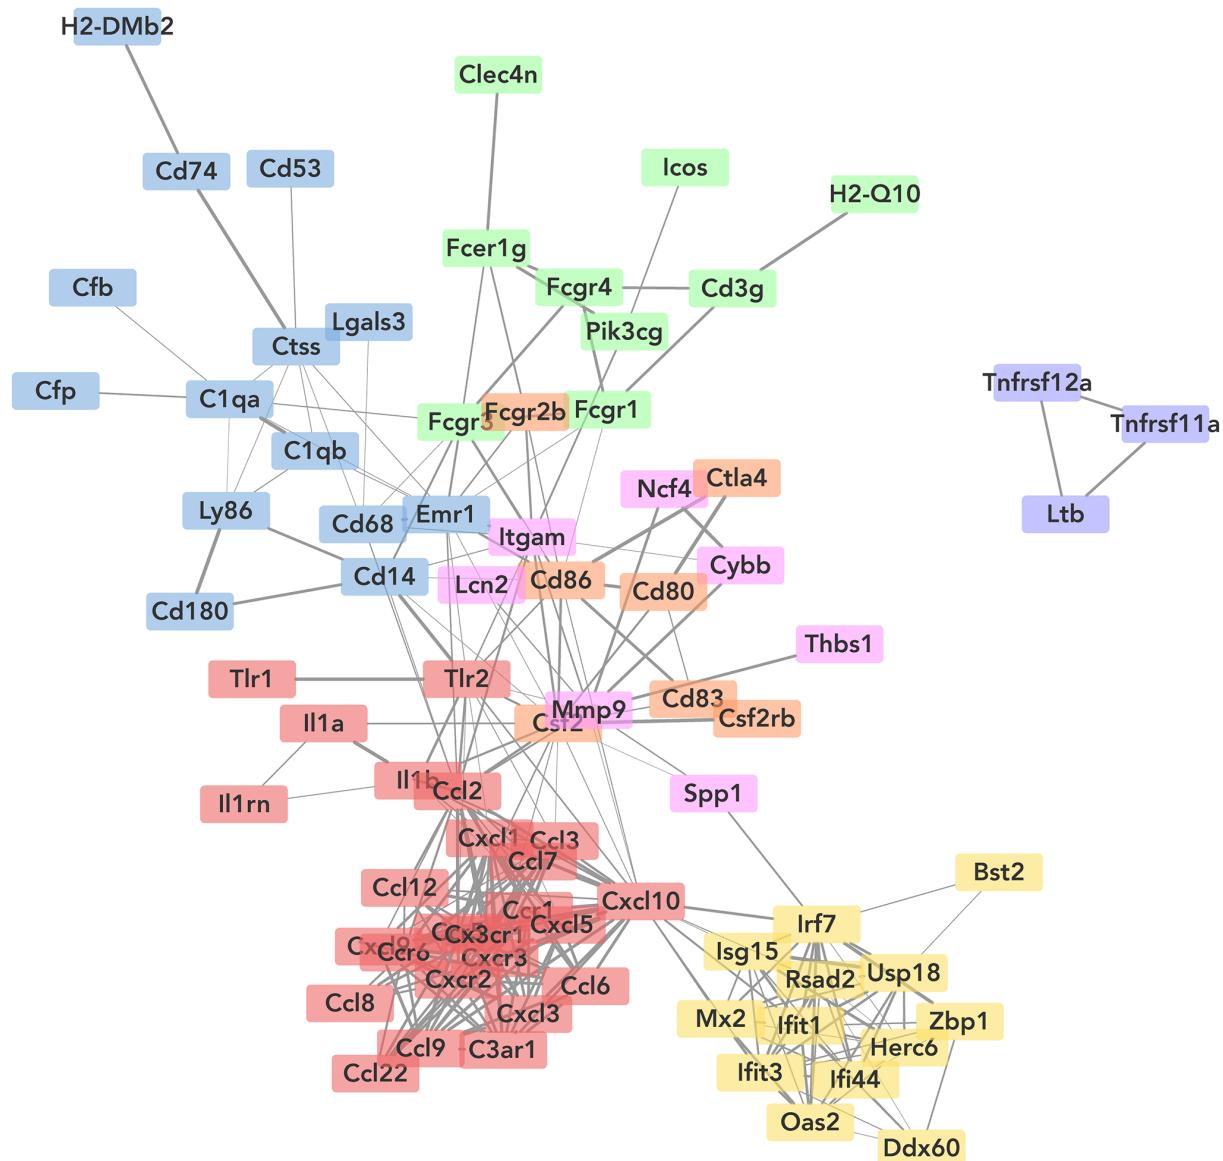

Supplementary figure 5. Volcano plots depicting immune-related mRNA expression as measured using the nanoString Mouse PanCancer Immune Panel. Values shown are the log₂ ratios of cSiO₂ treatment with respect to vehicle (VEH) controls plotted against the -log₁₀ Benjamini-Hochberg false discovery rate q value. A significant difference in gene expression was inferred for genes with BH q value <0.05 and log₂ ratio >1 or <-1 . Horizontal lines indicate q value cutoffs of 0.1, 0.05 and 0.01, and the vertical shaded region indicates expression values that do not meet the fold change cutoff for significance. (A) Acute.1x, lung tissues from mice 1 day post single cSiO₂ instillation versus dosing-matched VEH control. (B) Acute.4x, lung tissues from mice 1 day post four weekly cSiO₂ instillations versus dosing-matched VEH control; (C-F) Lung.W1, Lung.W5, Lung.W9, and Lung.W13, lung tissues from cSiO₂-treated (four weekly instillations) at 1, 5, 9, or 13 weeks post final instillation compared to time-matched VEH controls; (G) Kidney.W13, kidney tissues from cSiO₂-treated (four weekly instillations) at 13 weeks post final instillation compared to tissue-matched VEH controls; (H) Spleen.W13, spleen tissues from cSiO₂-treated (four weekly instillations) at 13 weeks post final instillation compared to tissue-matched VEH controls.

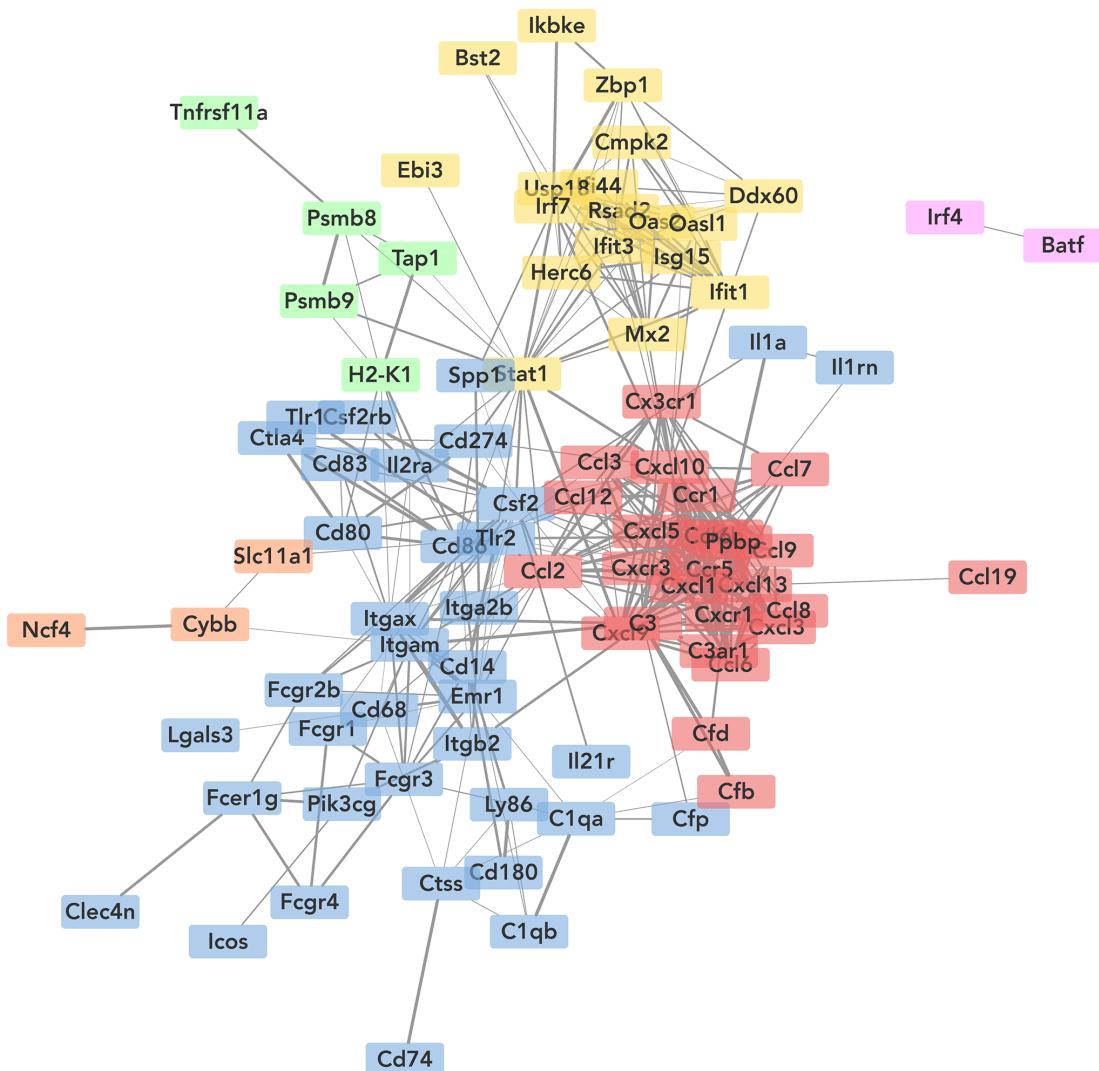

Supplementary figure 6. Network visualization of significant differentially expressed immune response genes in lung tissues of mice treated with cSiO₂ (four weekly doses) compared to dosing-matched vehicle controls 1 day post instillation (Acute.4x). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). Note, a network for mice treated only once with cSiO₂ was not made, as only five significant genes in that treatment group were identified. Major groupings include transcripts associated with interferon signaling (yellow), cytokine and chemokines (red), and innate and adaptive immune response (blue). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

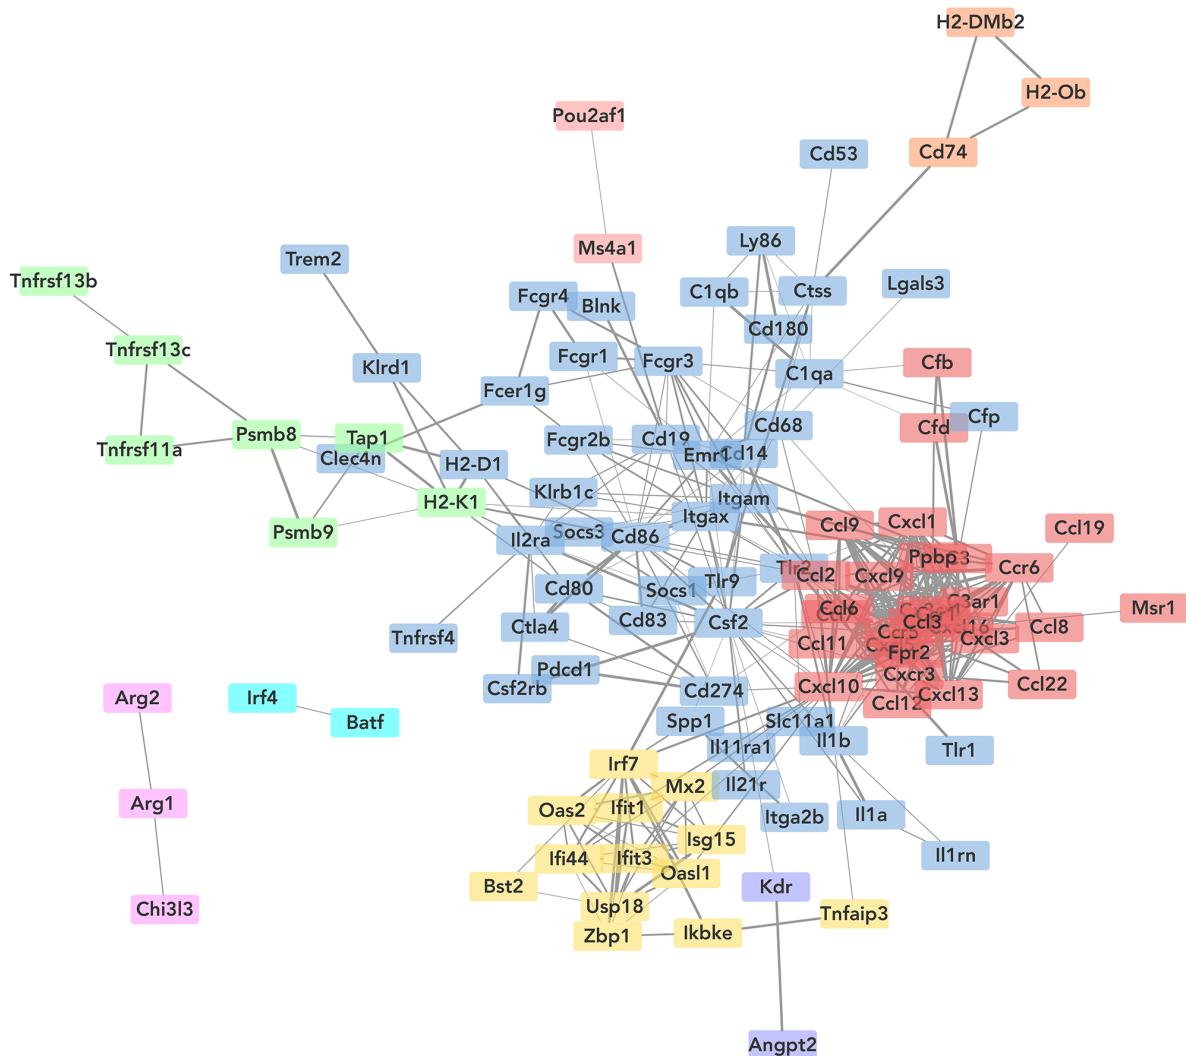

Supplementary figure 7. Network visualization of significant differentially expressed immune response genes in lung tissues of mice treated with cSiO₂ (four weekly doses) compared to time-matched vehicle controls 1 week post instillation (Lung.W1). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). Major groupings include transcripts associated with interferon signaling (yellow), cytokine and chemokines (red), complement (green), and innate and adaptive immune response (blue). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

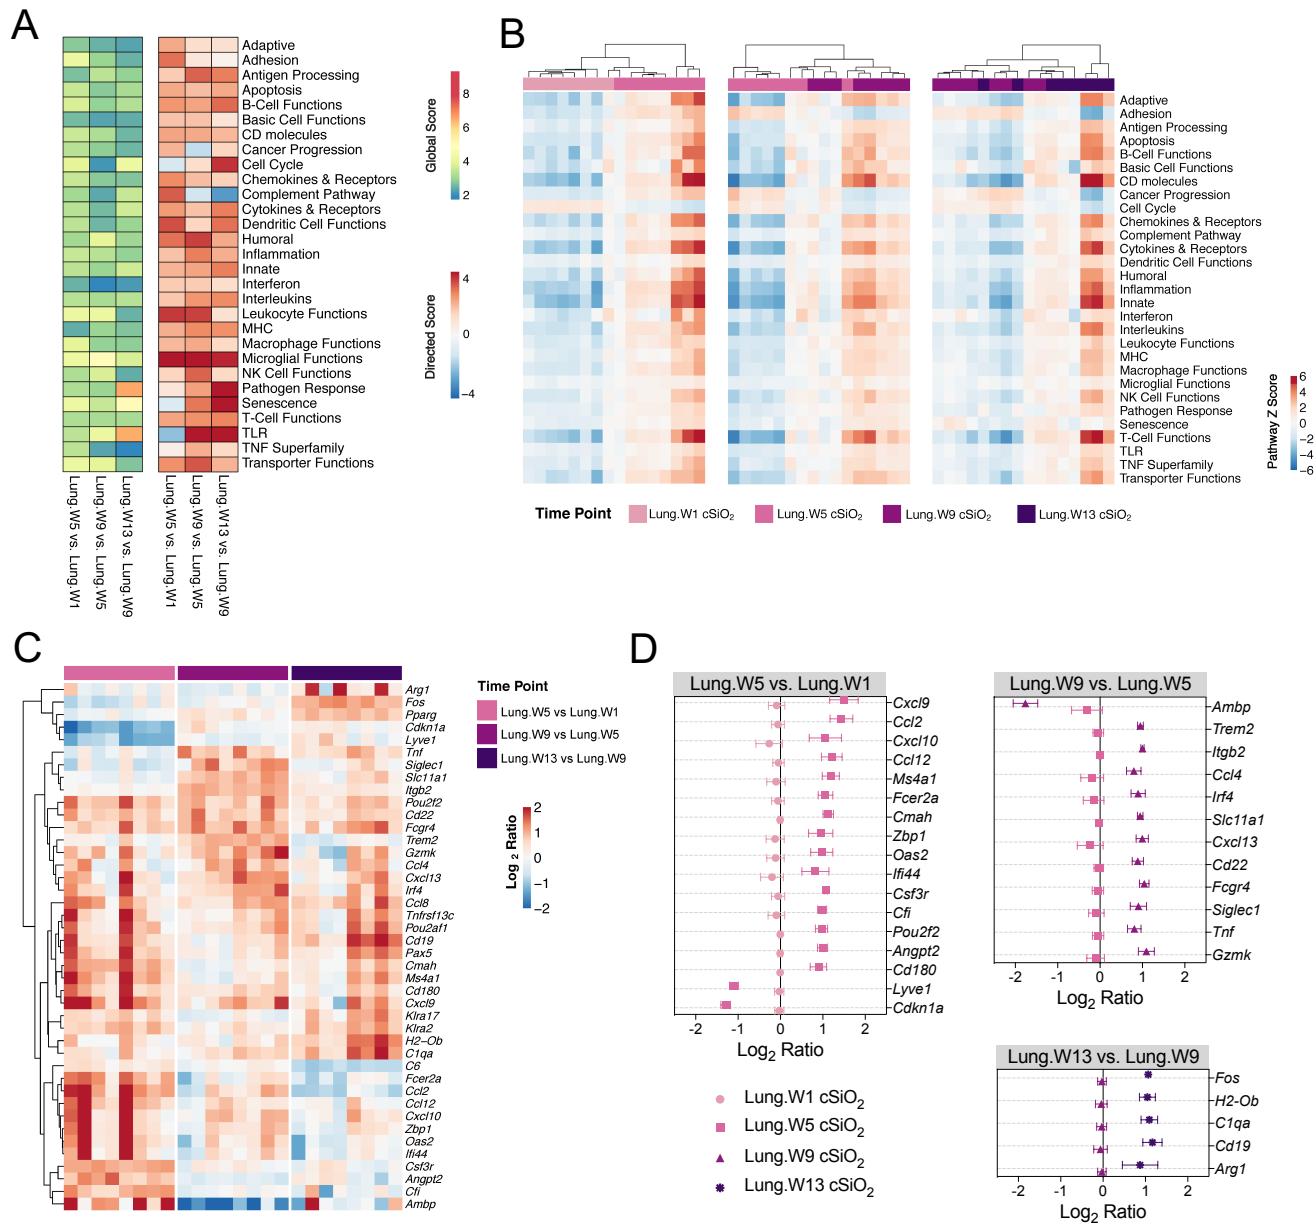

Supplementary figure 8. Network visualization of significant differentially expressed immune response genes in lung tissues of mice treated with cSiO₂ (four weekly doses) compared to time-matched vehicle controls 5 weeks post instillation (Lung.W5). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). Major groupings include transcripts associated with interferon signaling (yellow), cytokine and chemokines (red), complement (green), and innate and adaptive immune response (blue & green). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

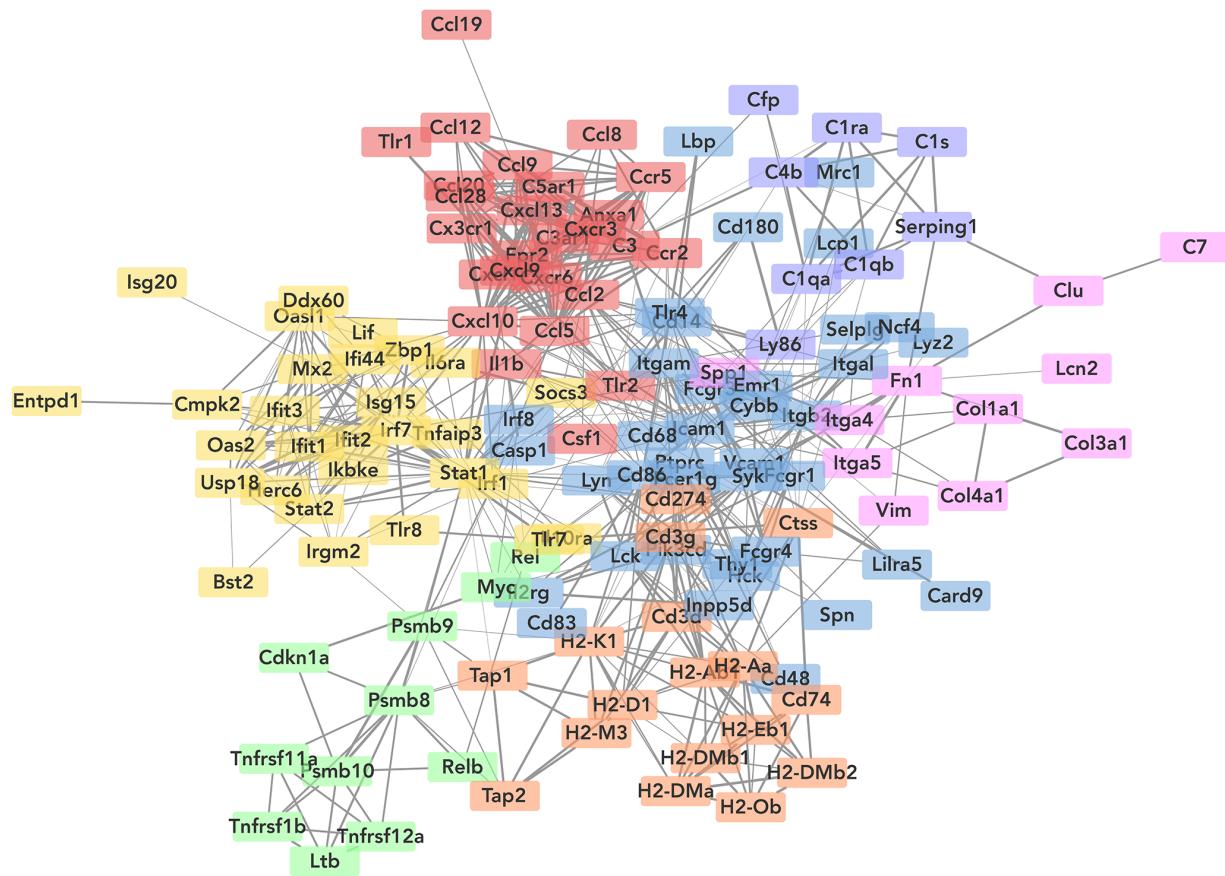

Supplementary figure 9. Network visualization of significant differentially expressed immune response genes in lung tissues of mice treated with cSiO₂ (four weekly doses) compared to time-matched vehicle controls 9 weeks post instillation (Lung.W9). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

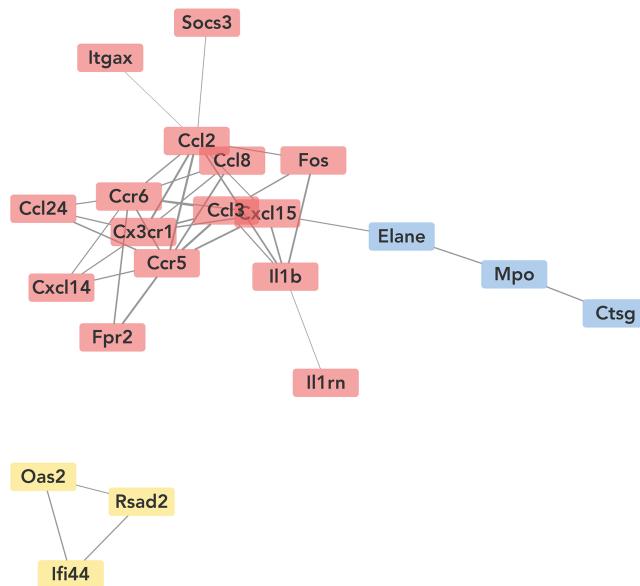

Supplementary figure 10. Network visualization of significant differentially expressed immune response genes in lung tissues of mice treated with cSiO₂ (four weekly doses) compared to time-matched vehicle controls 13 weeks post instillation (Lung.W13). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

Supplementary figure 11. Comparison of transcriptional response by time point in lung tissues of cSiO₂-exposed mice. Mice received four repeated weekly doses of cSiO₂ via intranasal instillation, and gene expression was determined in lung tissues obtained at 1, 5, 9, or 13 weeks post instillation. (A) Heatmaps depicting either global or directed significance scores for immune-related pathways (see Materials and Methods for details on calculation of significance scores). (B) Heatmap depicting individual pathway Z scores of each immune pathway when comparing time points progressively: W1 vs W5, W5 vs W9, W9 vs W13. (C) Heatmap depicting gene expression for differentially expressed genes for any of the time point comparisons. Values shown are the log₂ ratio compared to the average expression for the previous time point, as indicated. (D) Selected differentially expressed genes for each time point comparison are shown as dot plots for the average log₂ ratio expression ± SEM for each comparison indicated.

Supplementary figure 12. Network visualization of significant differentially expressed immune response genes in kidney tissues of mice treated with cSiO₂ (four weekly doses) compared to tissue-matched vehicle controls 13 weeks post instillation (Kidney.W13). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

Supplementary figure 13. Network visualization significant differentially expressed immune response genes in spleen tissues of mice treated with cSiO₂ (four weekly doses) compared to tissue-matched vehicle controls 13 weeks post instillation (Spleen.W13). Network interactions were modeled using the STRING database (string-db.org) with a minimum required interaction score ≥ 0.7 , and clusters were identified using the Markov Cluster (MCL) algorithm with inflation parameter of 1.5. The network was visualized in Cytoscape, and edge widths reflect the combined interaction score (thicker edges indicate higher score). See Supplementary file 6 for protein-protein interactions and functional annotations obtained from the STRING database.

Supplementary Table 1. Significant differentially expressed genes in lung tissues of mice following single cSiO₂ dose (experiment 1)

Gene symbol	Log₂ ratio cSiO₂/VEH				Associated pathways
	SEM	95% CI	FDR q value		
<i>Ccl24</i>	3.28	0.767	1.78, 4.79	0.0459	Adaptive, Chemokines & Receptors, Cytokines & Receptors, Inflammation
<i>Arg1</i>	2.82	0.674	1.50, 4.14	0.0465	Basic Cell Functions
<i>Chil3</i>	2.65	0.641	1.39, 3.91	0.0481	Basic Cell Functions
<i>Cxcl5</i>	2.54	0.466	1.62, 3.45	0.0288	Chemokines & Receptors, Cytokines & Receptors, Inflammation, Leukocyte Functions
<i>Lcn2</i>	1.76	0.391	0.995, 2.53	0.0459	Apoptosis, Innate, Transporter Functions

Note: Values shown are the calculated mean log₂ ratios, SEM and 95% confidence intervals of transcript counts for lung tissues obtained from cSiO₂-treated mice with respect to dosing-matched (single dose) vehicle treated mice 1 day post instillation. Statistical analysis was performed using nSolver software (nanoString) with the Benjamini-Hochberg method for control of false discoveries ($\alpha=0.05$); FDR-corrected *q* values are shown. Pathway associations for each significant gene are also shown.

Supplementary Table 2. Significant differentially expressed genes in lung tissues of mice following four cSiO₂ doses (experiment 2).

Note: Values shown are the calculated mean \log_2 ratios, SEM and 95% confidence intervals of transcript counts for lung tissues of cSiO₂-treated mice with respect to time-matched vehicle-treated mice 1 week post instillation. Statistical analysis was performed using nSolver software (nanoString) with the Benjamini-Hochberg method for control of false discoveries ($\alpha=0.05$); FDR-corrected *q* values are shown. Pathway associations for each significant gene are also shown.

Supplementary Table 4. Significant differentially expressed genes in lung tissues of mice at 5 weeks post cSiO₂ instillation (experiment 3).

Note: Values shown are the calculated mean log₂ ratios, SEM and 95% confidence intervals of transcript counts for lung tissues of cSiO₂-treated mice with respect to time-matched vehicle-treated mice 9 weeks post instillation. Statistical analysis was performed using nSolver software (nanoString) with the Benjamini-Hochberg method for control of false discoveries ($\alpha=0.05$); FDR-corrected *q* values are shown. Pathway associations for each significant gene are also shown.

Supplementary Table 6. Significant differentially expressed genes in lung tissues of mice at 13 weeks post cSiO₂ instillation (experiment 3).

Note: Values shown are the calculated mean log₂ ratios, SEM and 95% confidence intervals of transcript counts for lung tissues of cSiO₂-treated mice with respect to time-matched vehicle-treated mice 13 weeks post instillation. Statistical analysis was performed using nSolver software (nanoString) with the Benjamini-Hochberg method for control of false discoveries ($\alpha=0.05$); FDR-corrected *q* values are shown. Pathway associations for each significant gene are also shown.

Supplementary Table 7. Significant differentially expressed genes in kidney tissues of mice at 13 weeks post cSiO₂ instillation (experiment 3).

Note: Values shown are the calculated mean log₂ ratios, SEM and 95% confidence intervals of transcript counts for kidney tissues of cSiO₂-treated mice with respect to time-matched vehicle-treated mice 13 weeks post instillation. Statistical analysis was performed using nSolver software (nanoString) with the Benjamini-Hochberg method for control of false discoveries ($\alpha=0.05$); FDR-corrected *q* values are shown. Pathway associations for each significant gene are also shown.

Supplementary Table 8. Significant differentially expressed genes in spleen tissues of mice at 13 weeks post cSiO₂ instillation (experiment 3).
