# Synthesis, Isolation and Structure Determination of Cannabidiol Derivatives and their cytotoxic potential 

Yedukondalu Nalli, Suraya Jan, Gianluigi Lauro, Javeed Ur Rasool, Waseem I. Lone, Aminur R. Sarkar, Junaid Banday, Giuseppe Bifulco, Hartmut Laatsch, Sajad H. Syed and Asif Ali ABSTRACT

In a continuing effort to explore the structural diversity and pharmacological activities of natural products based scaffolds, herein, we report the isolation, synthesis, and structure determination of cannabidiol and its derivatives along with their cytotoxic activities. Treatment of cannabidiol (1) with acid catalyst $\mathrm{POCl}_{3}$ afforded a new derivative $\mathbf{6}$ along with six known molecules 2-5, $\mathbf{7}$ and, 8. The structure of 6 was elucidated by extensive spectroscopic analyses and DFT calculations of the NMR and ECD data. All the compounds (2-8) were evaluated for their cytotoxic potential against a panel of eight cancer cell lines. Compounds $\mathbf{4}, \mathbf{5}, \mathbf{7}$, and $\mathbf{8}$ showed pronounced in vitro cytotoxic activity with GI50 values ranging from 5.6 to $60 \mu \mathrm{M}$. Out of the active molecules, compounds $\mathbf{4}$, and 7 were found to be comparable to that of the parent molecule 1 on the inhibition of almost all the tested cancer cell lines.

## TABLE OF CONTENTS

Table S1. ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) \& ${ }^{13} \mathrm{C}$ NMR ( 100 MHz ) NMR Spectroscopic Data for Compound 6 in $\mathrm{CDCl}_{3}$
Table S2. ${ }^{13} \mathrm{C}$ experimental and calculated NMR chemical shifts for $\mathbf{6 a}$ and $\mathbf{6 b}$, with ${ }^{\mathrm{a}}|\Delta \delta|\left({ }^{13} \mathrm{C}\right)$ and ${ }^{\mathrm{c}}$ MAE values. Chemical shift data here reported were produced using benzene as reference compound for $s p^{2}$ carbons, and tetramethylsilane (TMS) for $s p^{3}$ carbons.
Table S3. ${ }^{1}$ H experimental and calculated NMR chemical shifts for $\mathbf{6 a}$ and $\mathbf{6 b}$, with ${ }^{a}|\Delta \delta|\left({ }^{1} \mathrm{H}\right)$ and ${ }^{c}$ MAE values. Chemical shift data here reported were produced using benzene as reference compound for $s p^{2}$ carbons, and tetramethylsilane (TMS) for $s p^{3}$ carbons.
Table S4. ${ }^{13} \mathrm{C}$ experimental and calculated NMR chemical shifts for $\mathbf{6 a}$ and $\mathbf{6 b}$, with ${ }^{\mathrm{a}}|\Delta \delta|\left({ }^{13} \mathrm{C}\right)$ and ${ }^{\text {b }}$ MAE values. Chemical shift data here reported were produced using tetramethylsilane (TMS) as reference compound.
Table S5. ${ }^{1} \mathrm{H}$ experimental and calculated NMR chemical shifts for $\mathbf{6 a}$ and $\mathbf{6 b}$, with ${ }^{a}|\Delta \delta|\left({ }^{1} \mathrm{H}\right)$ and ${ }^{\text {b }}$ MAE values. Chemical shift data here reported were produced using tetramethylsilane (TMS) as reference compound.

| $\mathbf{6 b}$ | 1.78 | 0.17 | $100.00 \%$ |

Figure S1. ${ }^{13} \mathrm{C} /{ }^{1} \mathrm{H}$ MAE instagrams related to compounds $\mathbf{6 a}$ and $\mathbf{6 b}$ (values reported in Table S6).

A QM/NMR approach (Bifulco et al. 2007, Di Micco et al. 2010) was employed to compare the sets of experimental ${ }^{13} \mathrm{C}$ and ${ }^{1} \mathrm{H}$ NMR chemical shifts with those calculated for $6 \mathbf{a}$ and $6 \mathbf{b}$ isomers. Firstly, all the conformers obtained at the empirical level were submitted to a geometry and energy optimization step at the DFT (density functional theory) using the MPW1PW91/6-31G(d) functional/basis set (see computational details, experimental section). Then, ${ }^{13} \mathrm{C}$ and ${ }^{1} \mathrm{H}$ NMR chemical shifts were predicted at the MPW1PW91/6-31G(d,p) level, and the mean absolute error (MAE) values were used to compare calculated and experimental values (Tables $\mathrm{S} 1-\mathrm{S} 5$ ) for $\mathbf{6 a}$ and $\mathbf{6 b}$. As shown in Figure S 1 , compound $\mathbf{6 b}$ showed the lowest ${ }^{13} \mathrm{C}$ and ${ }^{1} \mathrm{H}$ MAE values, 1.78 and 0.17 ppm , respectively. To further confirm our findings, we also employed the recently introduced DP4+ method (Grimblat et al. 2015). Again, the isomer 6b showed the highest DP4+ probabilities ( $100.00 \%$ ) (Table S6). Interestingly, the NOESY correlations were also found to be consistent with the $\mathbf{6 b}$ isomer. Finally, the absolute configurations were established by comparison of the experimental ECD spectrum of 6 with those predicted for $\mathbf{6 b}(6 R, 9 S, 10 S)$ and for its enantiomer $\mathbf{6} \mathbf{b}_{\text {enant }}(6 S, 9 R, 10 R)$ (Cerulli et al. 2017). The results showed that the calculated ECD spectrum of $\mathbf{6 b}$ was in accordance with the experimental spectrum (Figure S2). Accordingly, the absolute configuration of 6 was confidently assigned as $6 R, 9 S, 10 S$.

Figure S2. a) Superposition of the measured ECD spectrum of 6 and that computed for compound $\mathbf{6 b}(6 S, 9 R, 10 R)$; b)Superposition of the measured ECD spectrum of $\mathbf{6}$ and that computed for compound $\mathbf{6} \mathbf{b}_{\text {enant }}(6 R, 9 S, 10 S)$.
