SUPPLEMENTAL MATERIALS

Title: Alder distribution and expansion across a tundra hillslope: implications for local N cycling

Supplementary Figure 1. Spectral properties of Alder shrubland plots, based on EO-1 Hyperion. Back lines represent spectra from alder shrubland plots while grey lines represent spectra from other plant communities present at Kougarok.

Notice: This manuscript has been authored by UT-Battelle, LLC under Contract No. DE-AC05-00OR22725 with the U.S. Department of Energy. The United States Government retains and the publisher, by accepting the article for publication, acknowledges that the United States Government retains a non-exclusive, paid-up, irrevocable, world-wide license to publish or reproduce the published form of this manuscript, or allow others to do so, for United States Government purposes. The Department of Energy will provide public access to these results of federally sponsored research in accordance with the DOE Public Access Plan (http://energy.gov/downloads/doe-public-access-plan).

Supplementary Figure 2. Resin-N (Total inorganic N extracted from resins, panel a) and Resin-P (panel b) availability. Community type, deployment date, and an interaction between community type and deployment date all had a significant effect on Resin-N (p< 0.02). Deployment data had a significant effect on resin-P (p= 0.02).

Supplementary Table 1. Spectral and topographic remote sensing data used in the classification of Alder shrubland. (DN: Digital Numbers)

Sensor	Variable	Unit	Collection Date	Resolution	# of bands
SPOT-5	Green, Red, NIR (500-900 nm)	DN	June-September 2009-2012	2.5 m	3
USGS IfSAR DEM	Elevation	m	July 2012	5 m	1
EO-1	198 spectral bands (400-2500 nm)	DN	June 24, 2015	30 m	198
Landsat 8	9 spectral bands (400-2290 nm)	DN	August 17, 2016	30 m	9

Supplementary Table 2. Principal Components analysis of Alder nodule Biomass and aboveground traits. Asterisk (*) and bold type denote variable had a significant impact on Principal component. Significance was determined by bootstrapping of eigenvectors (p <0.05).

	Eigenvectors							
	PC1	PC2	PC3	PC4	PC5	PC6		
Nodule Biomass (g/m ²)	-0.41	0.28	-0.5	-0.5	0.5	-0.2		
Height (cm)	-0.37 *	0.53	0.3	0.6	0.2	-0.2		
Sun Leaf SLA (cm²/g)	-0.45 *	-0.08	0.5	-0.4	-0.5	-0.4		
Sun Leaf %N	-0.26 *	-0.76	0.2	0.2	0.5	-0.1		
Sun Leaf δ ¹⁵ N	0.37 *	0.23	0.7	-0.4	0.5	0.1		
Sun Leaf %P	-0.54 *	0.02	0.1	-0.1	-0.1	0.8		
	Importance of Components							
	PC1	PC2	PC3	PC4	PC5	PC6		
Standard deviation	1.80	1.07	0.9	0.6	0.6	0.2		
Proportion of Variance	0.54	0.19	0.1	0.1	0.1	0		
Cumulative Proportion	0.54	0.73	0.9	0.9	1	1		

Supplementary Table 3. Principal Components analysis of Alder N fixation and aboveground traits. Asterisk (*) and bold type denote variable had a significant impact on Principal component. Significance was determined by bootstrapping of eigenvectors (p <0.05).

	Eigenvectors						
	PC1	PC2	PC3	PC4	PC5	PC6	
N fixation (µmole N/g nodule/ hour)	0.21	-0.73 *	0.3	-0.1	-0.6	-0.1	
Height (cm)	-0.53 '	· -0.20	0.3	0	0.4	0.68 *	
Sun Leaf SLA (cm²/g)	-0.34 *	[•] 0.50 *	0.4	0.4	-0.6	-0.1	
Sun Leaf %N	-0.42 *	0.09	-0.4	-0.7	-0.4	0	
Sun Leaf δ ¹⁵ Ν	0.33 *	0.32	0.6	-0.6	0.2	0	
Sun Leaf %P	-0.52 *	⁻ -0.28	0.30	0	0.20	0.7	
	Importance of Components
