Astroparticle physics

Roberto A. Lineros

Departamento de Física, Universidad Católica del Norte

Winter School HEP-PUC 2019 "Topics on Graviticulas"

The Plan

1. Astroparticles
2. Cosmic-rays
3. Neutrinos
4. Gamma-rays
5. Gravitational Waves

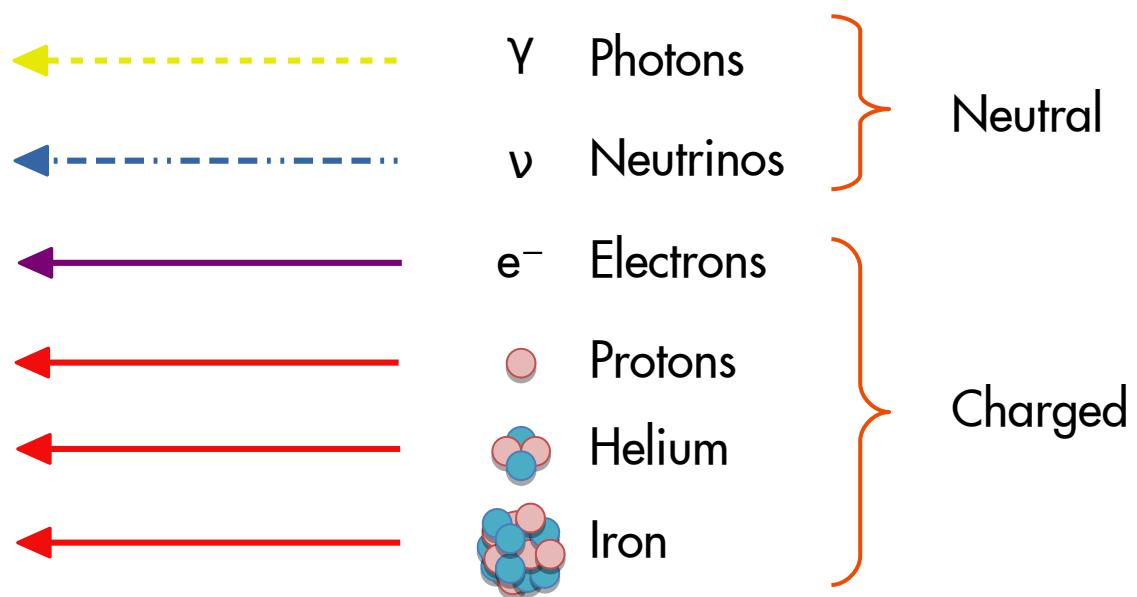

Dark Matter
Astrophysical Sources

Gamma-rays

and other wavelengths

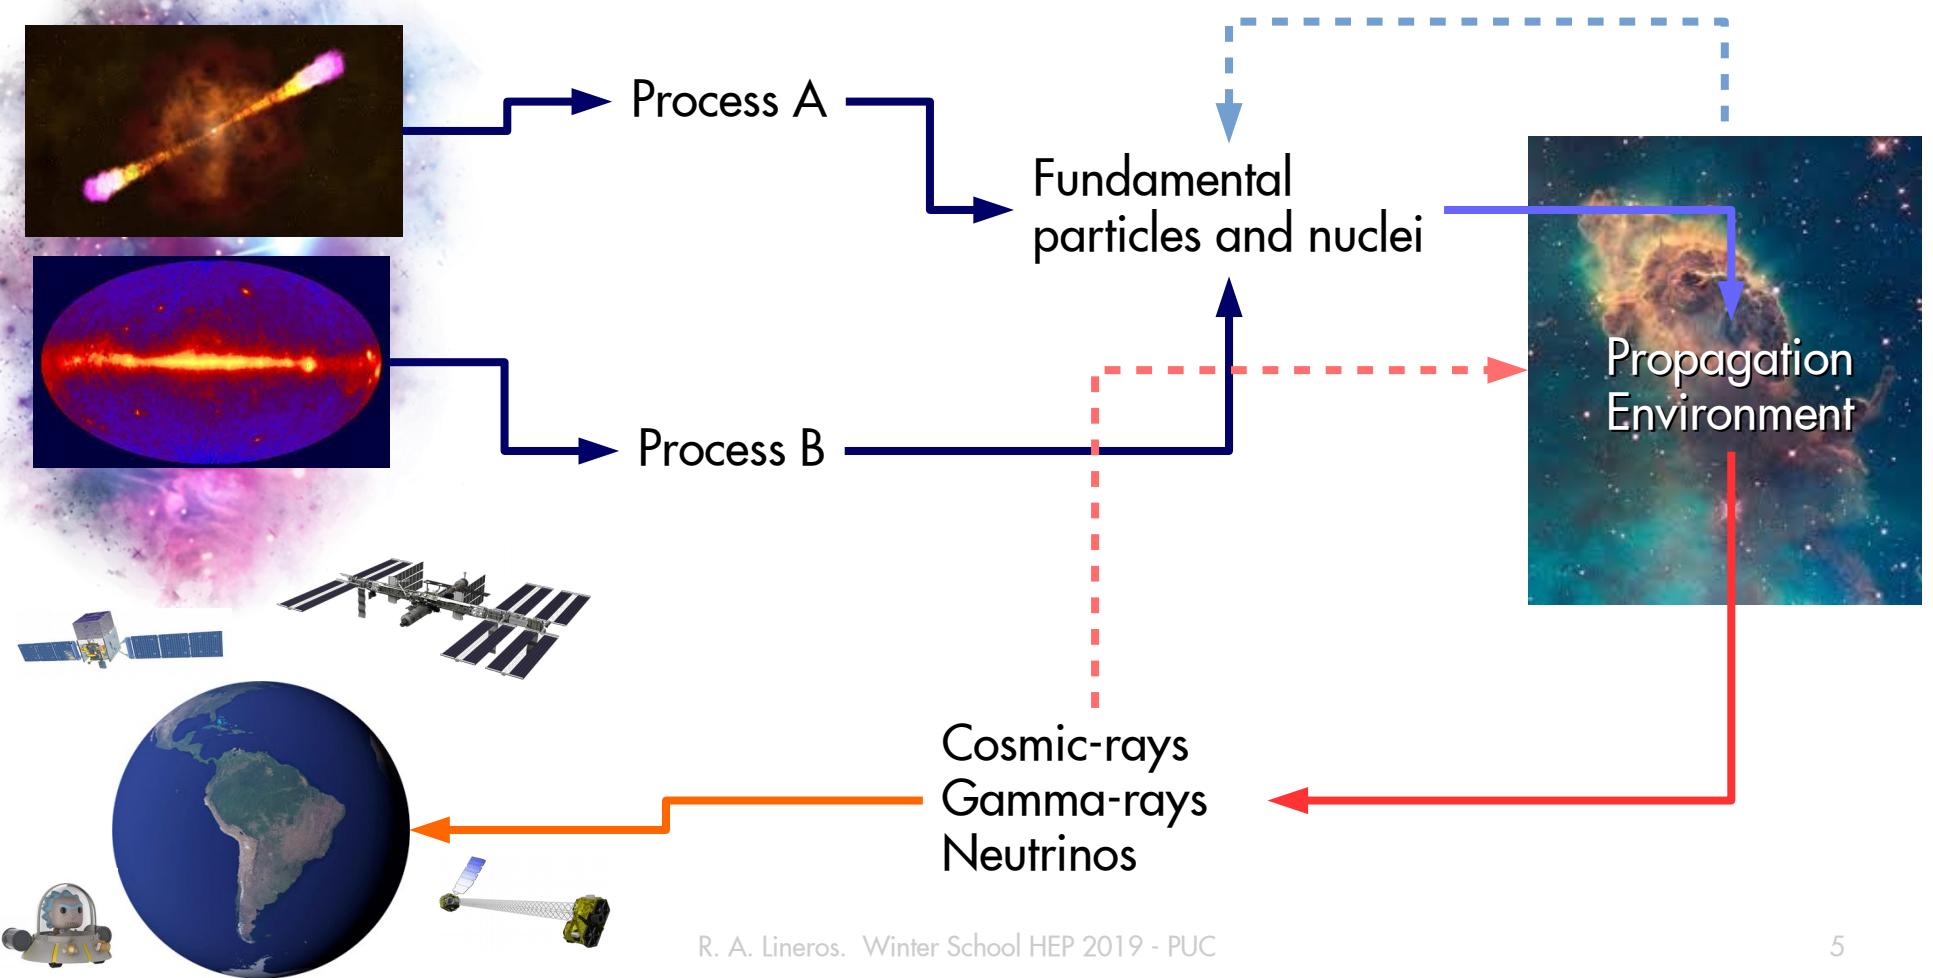

Particles from outer space

Any electrically charged particle may interact with photons

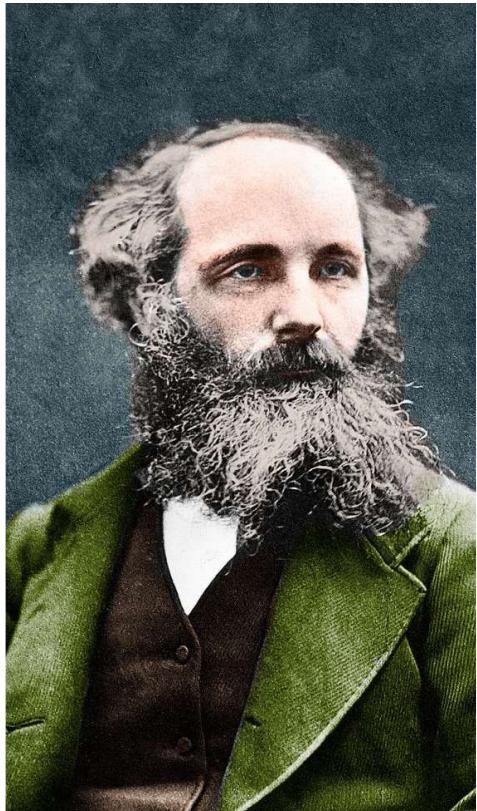

Multimessengers

Photon Physics

Maxwell's equations

Unified description of phenomena related to Electricity and Magnetism

$$\nabla \cdot \mathbf{E} = \frac{\rho}{\varepsilon_0}$$

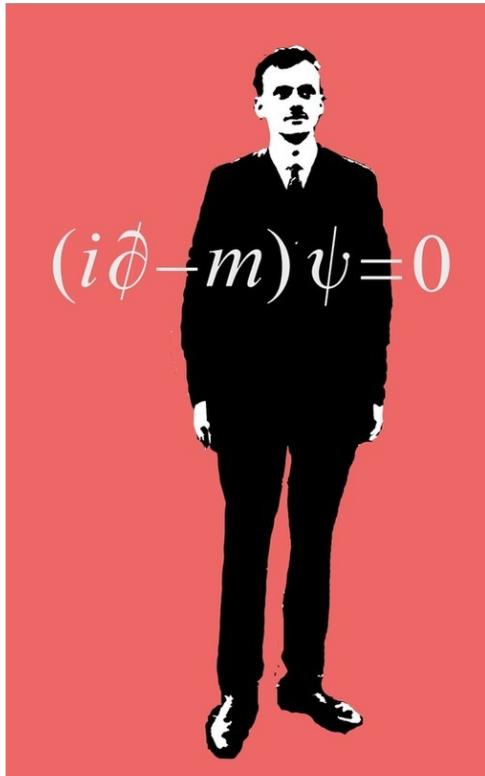

$$\nabla \cdot \mathbf{B} = 0$$

$$\nabla \times \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t}$$

$$\nabla \times \mathbf{B} = \mu_0 \mathbf{J} + \mu_0 \varepsilon_0 \frac{\partial \mathbf{E}}{\partial t}$$

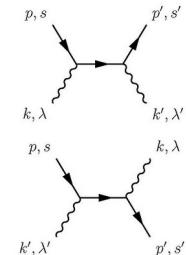

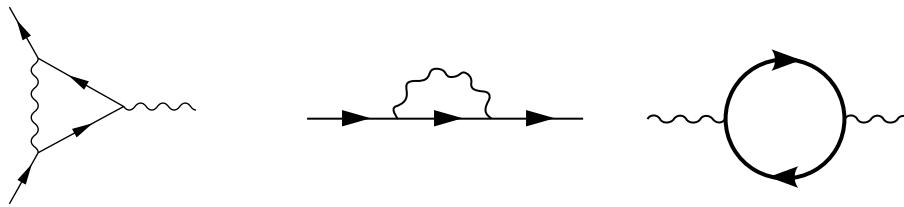

They describe most of the classical aspects of modern physics

Quantum electrodynamics

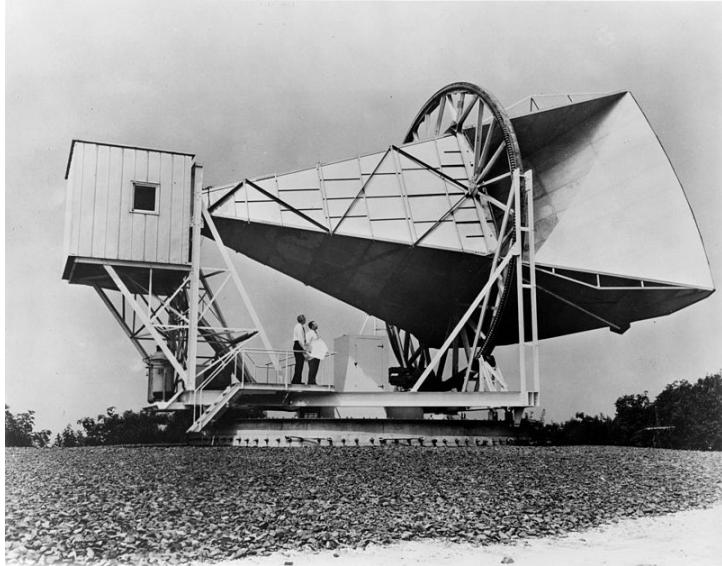

A description of the quantum nature of interactions between electromagnetic fields and electric charges.

$$\mathcal{L} = \bar{\psi} (i\gamma^\mu D_\mu - m) \psi - \frac{1}{4} F_{\mu\nu} F^{\mu\nu}$$

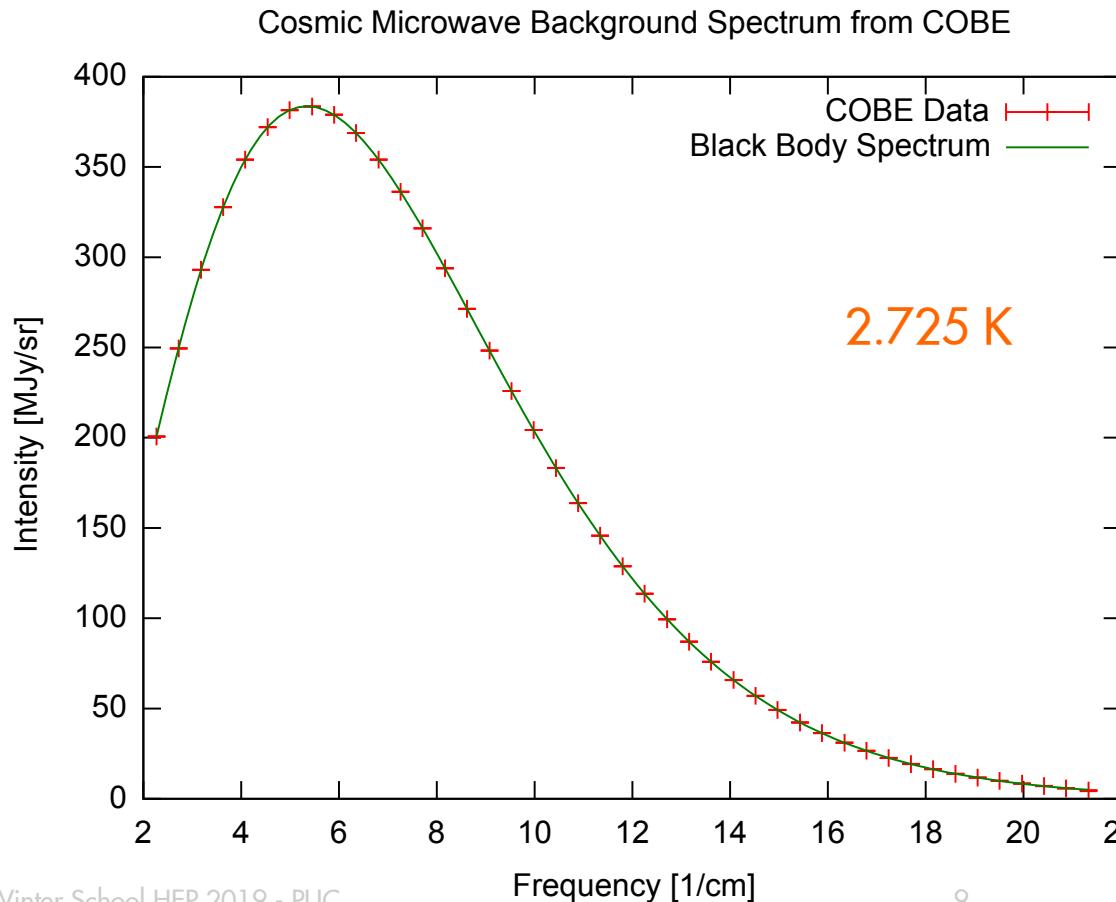

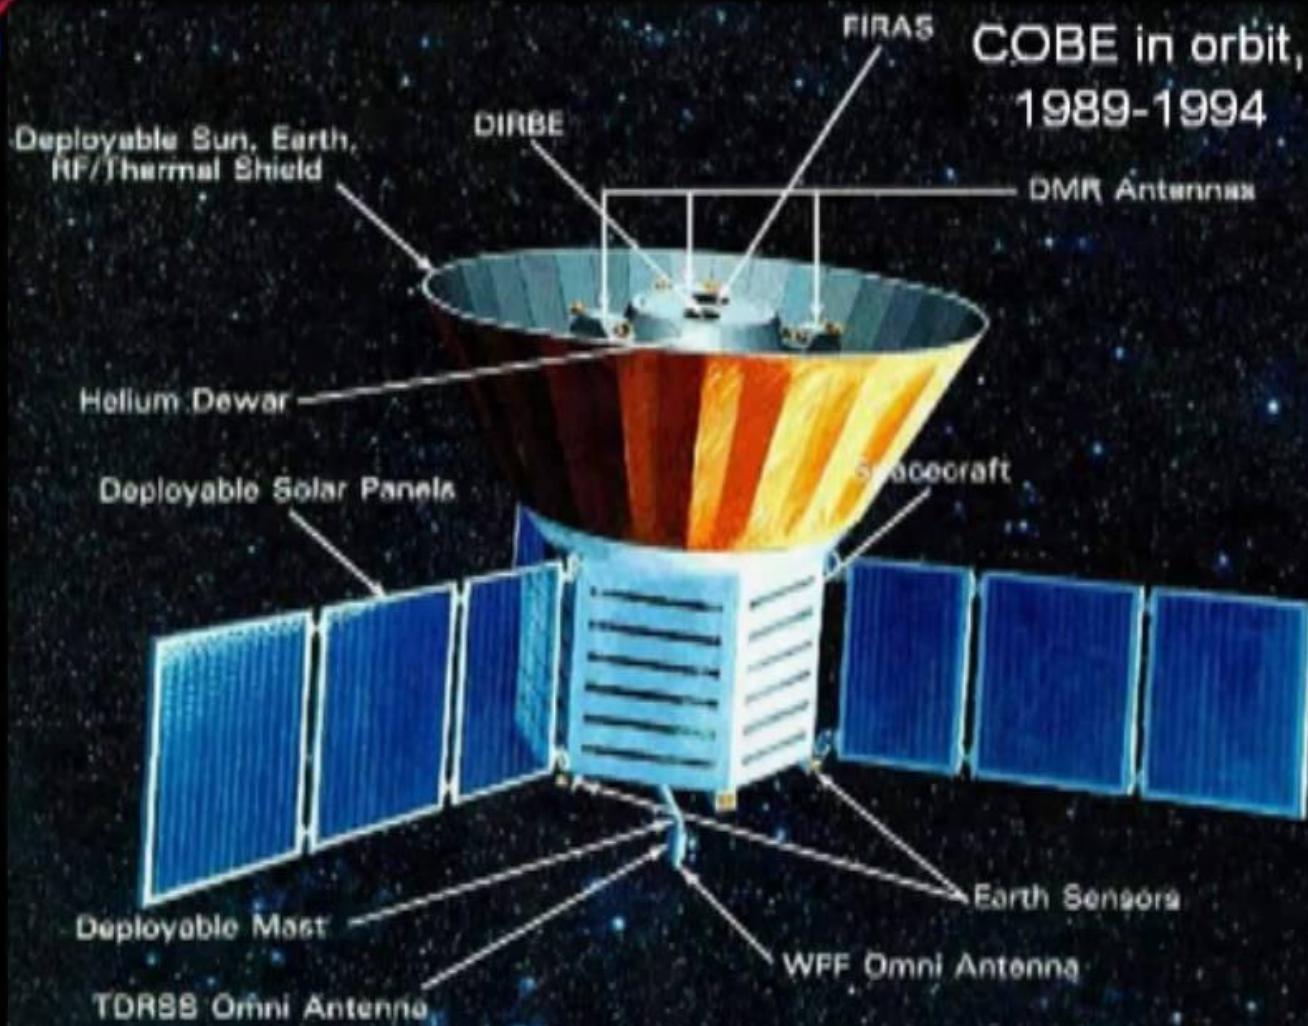

One of the foundational column to build the Standard Model

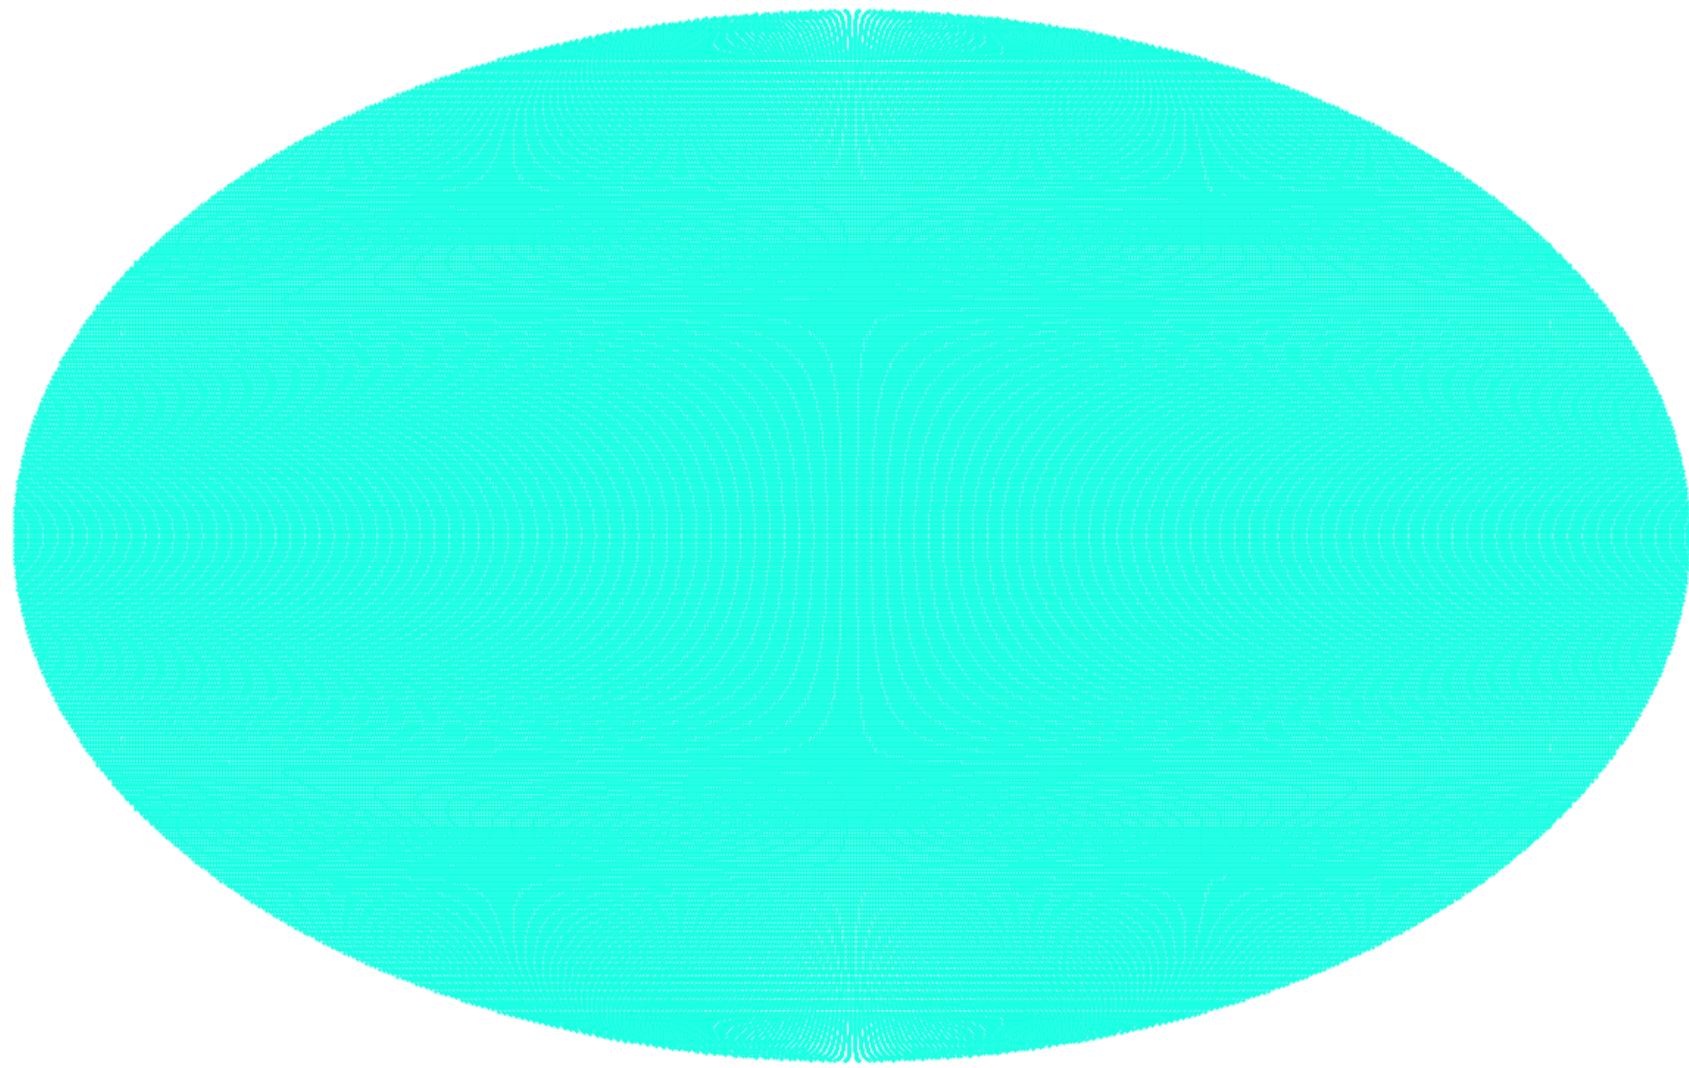

Cosmic Microwave Background

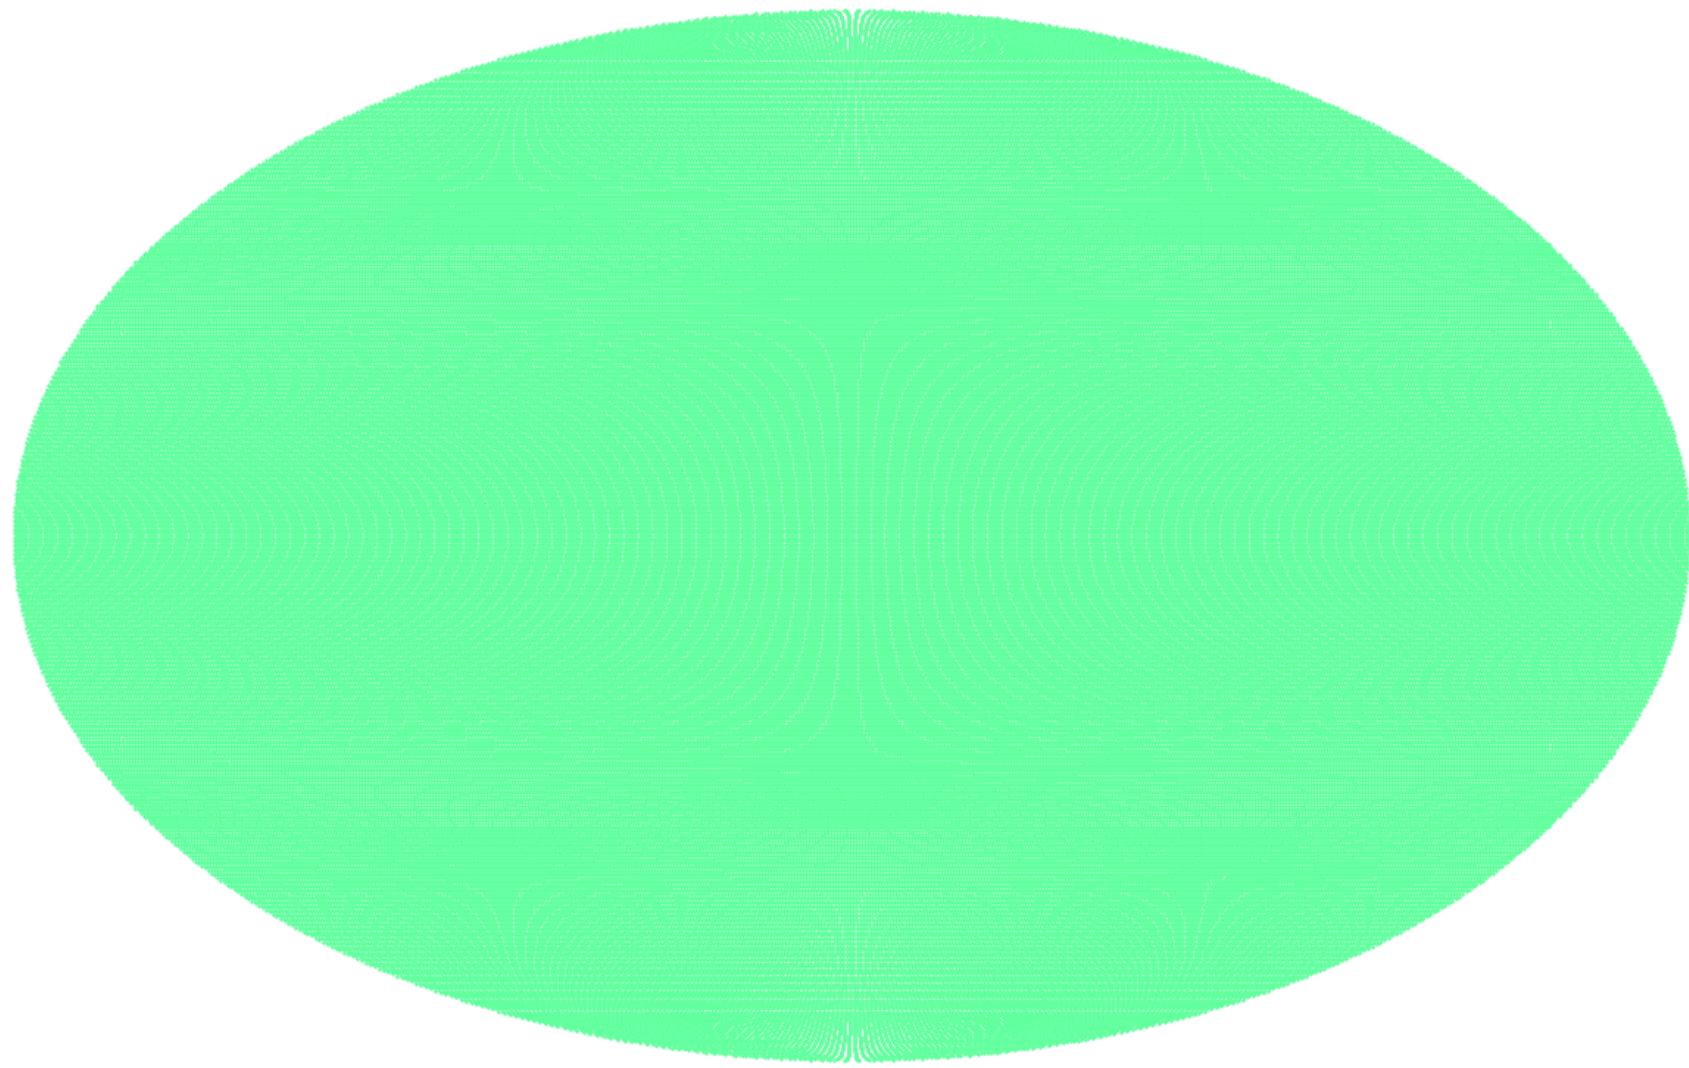

The Holmdel Horn Antenna on which Penzias and Wilson discovered the cosmic microwave background.

The CMB is very homogeneous but...

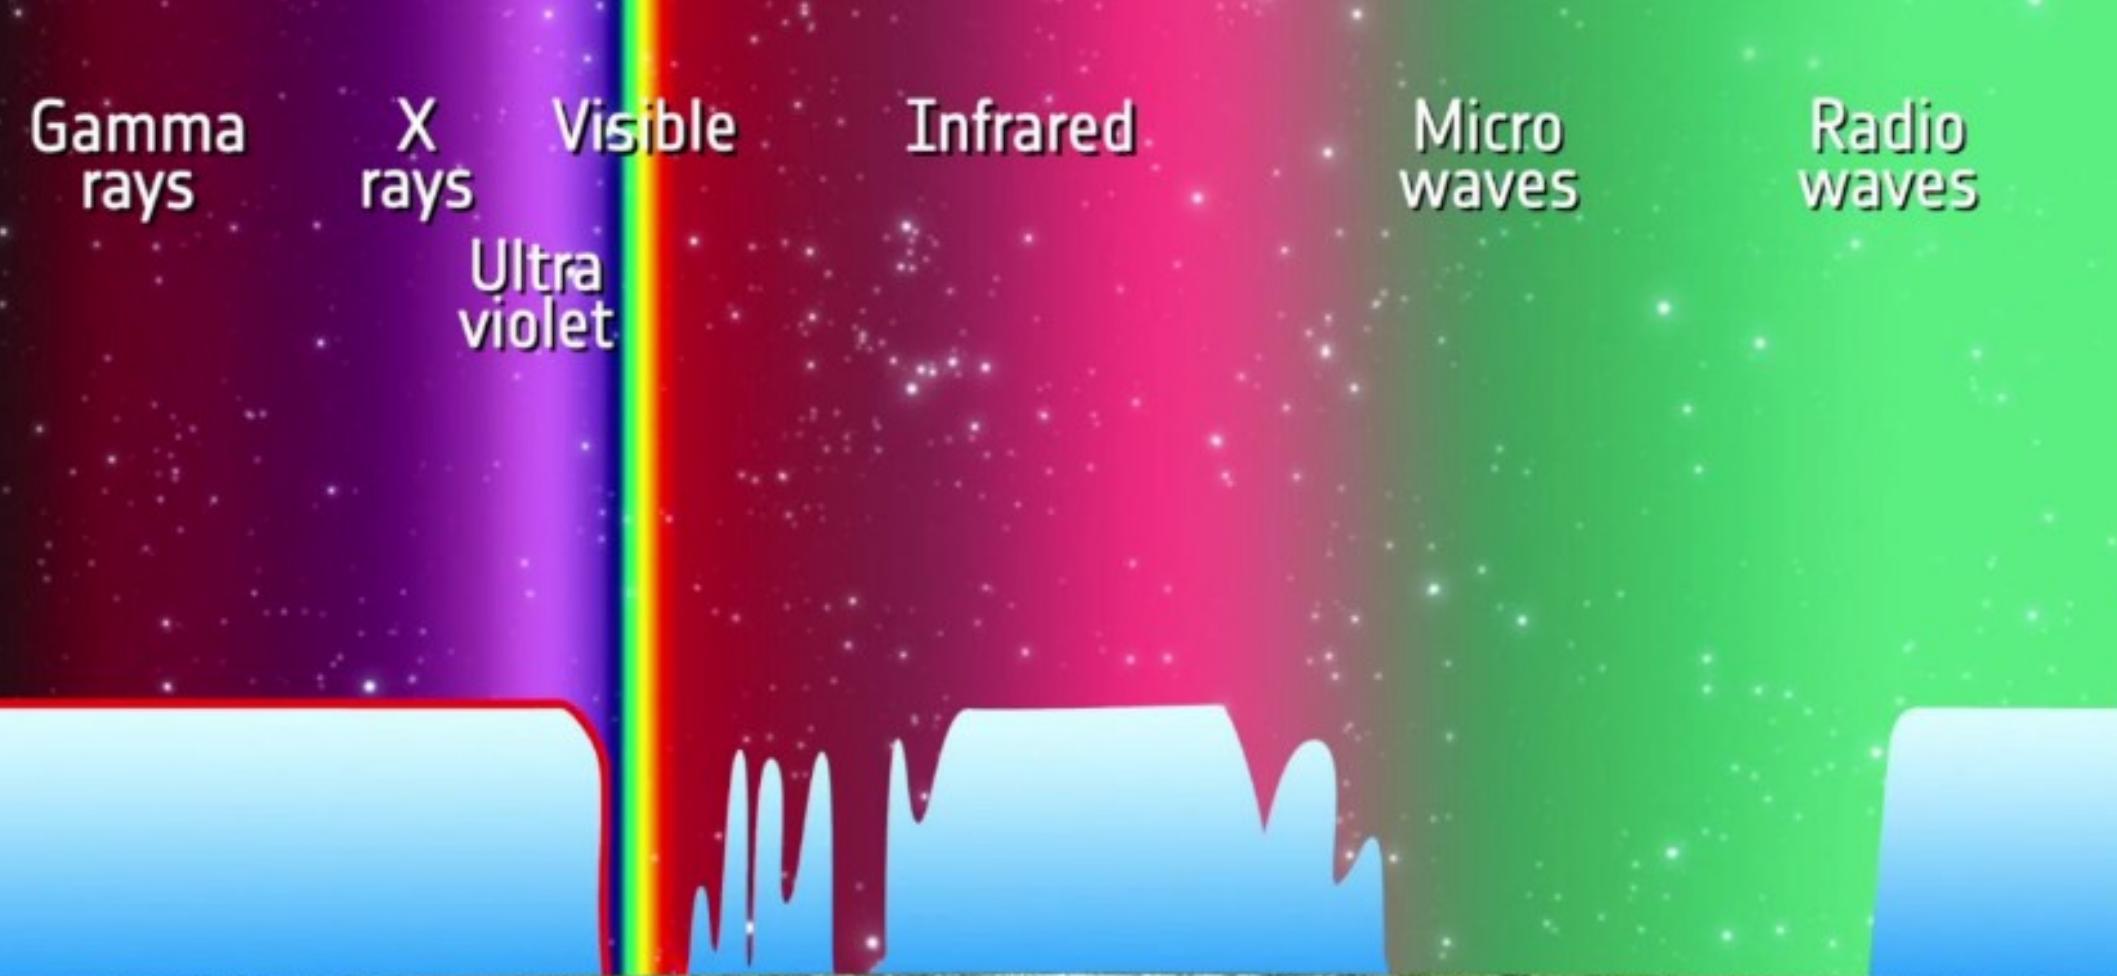

CMB anisotropies

CMB anisotropies

-200 μK 200 μK

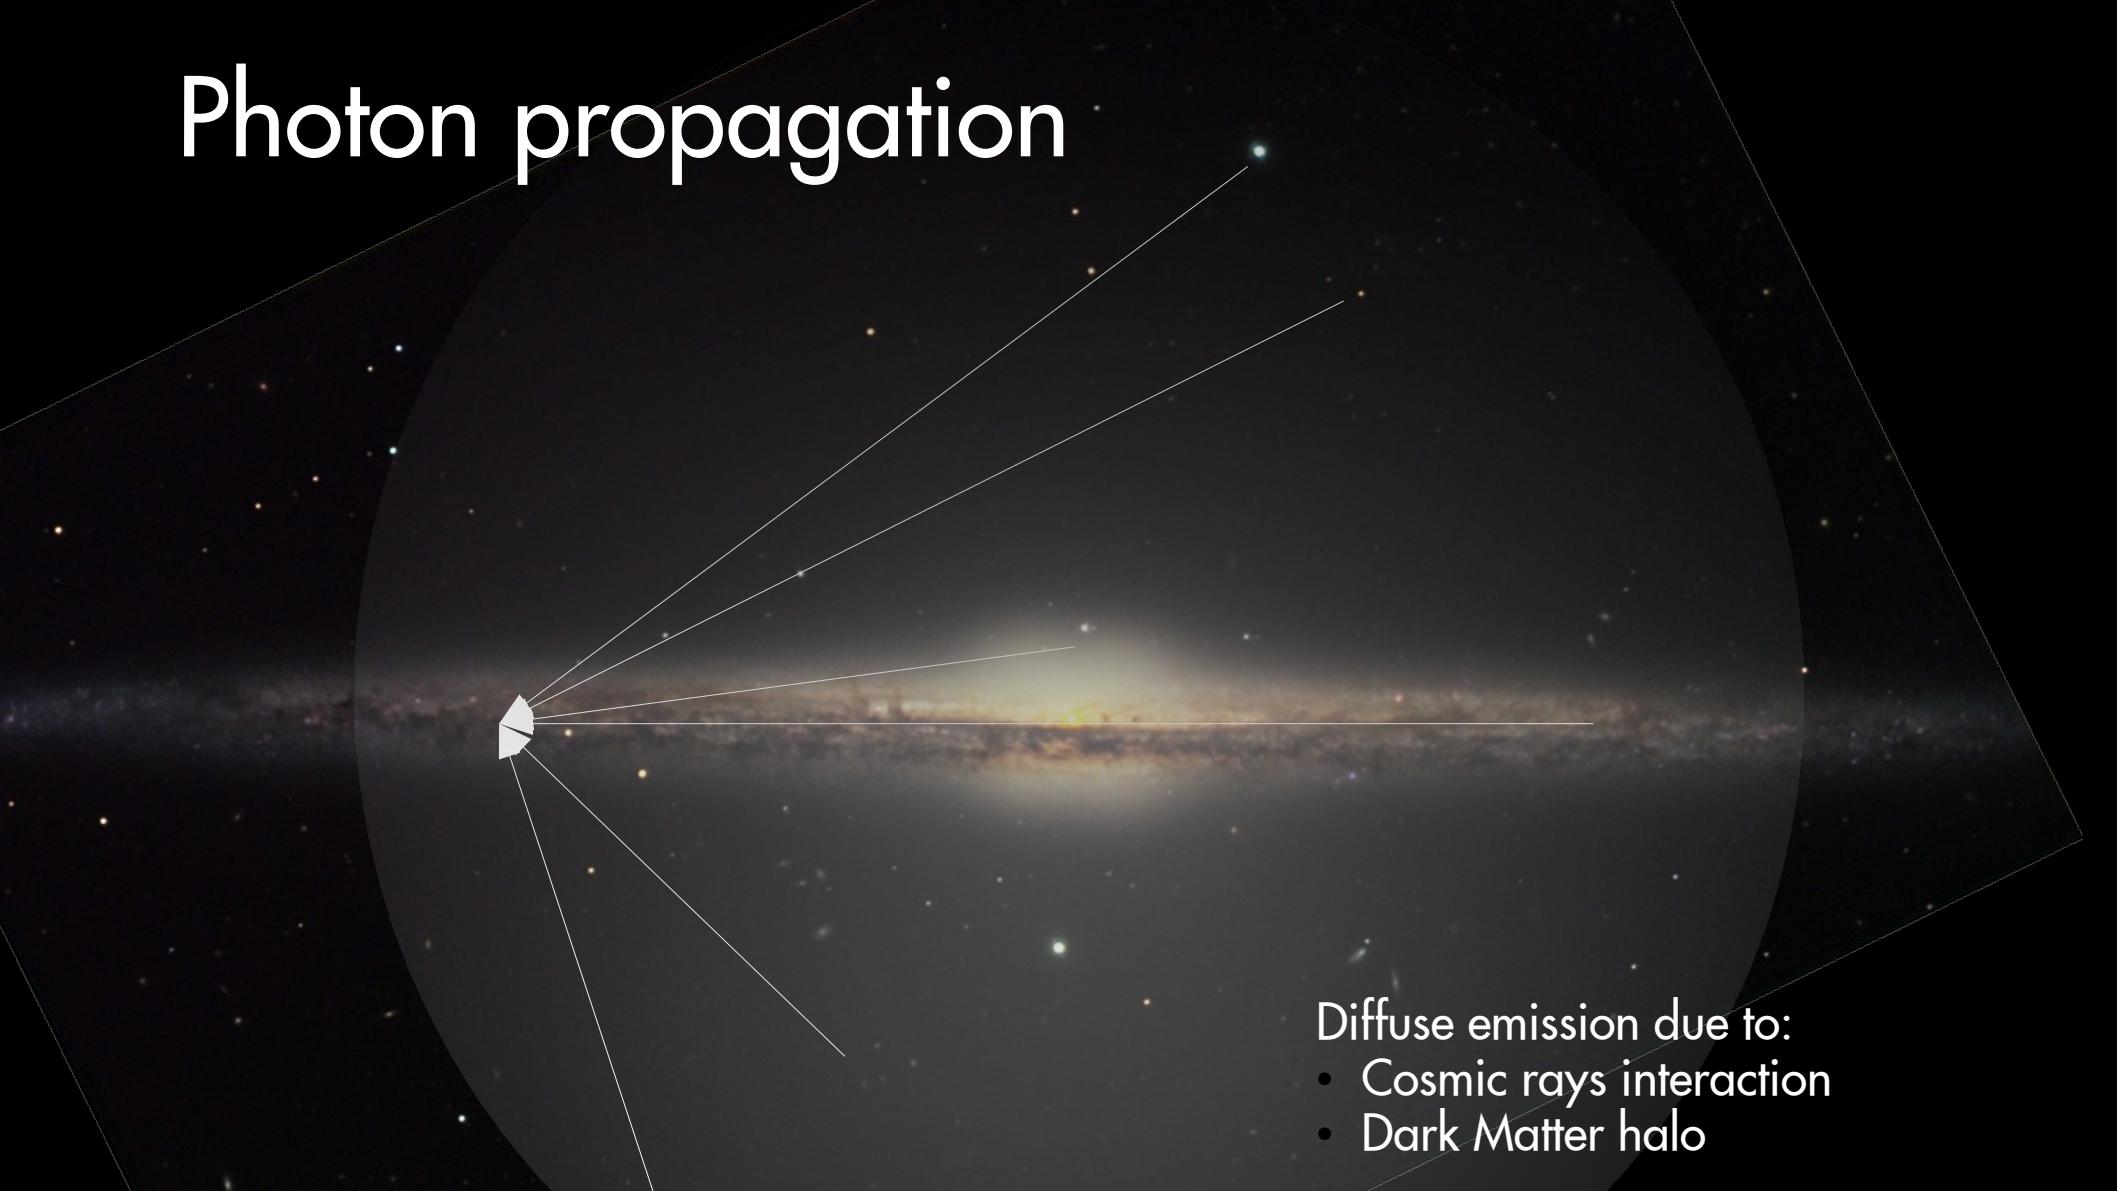

Electromagnetic spectrum

Photon propagation

Photons follow a straight line

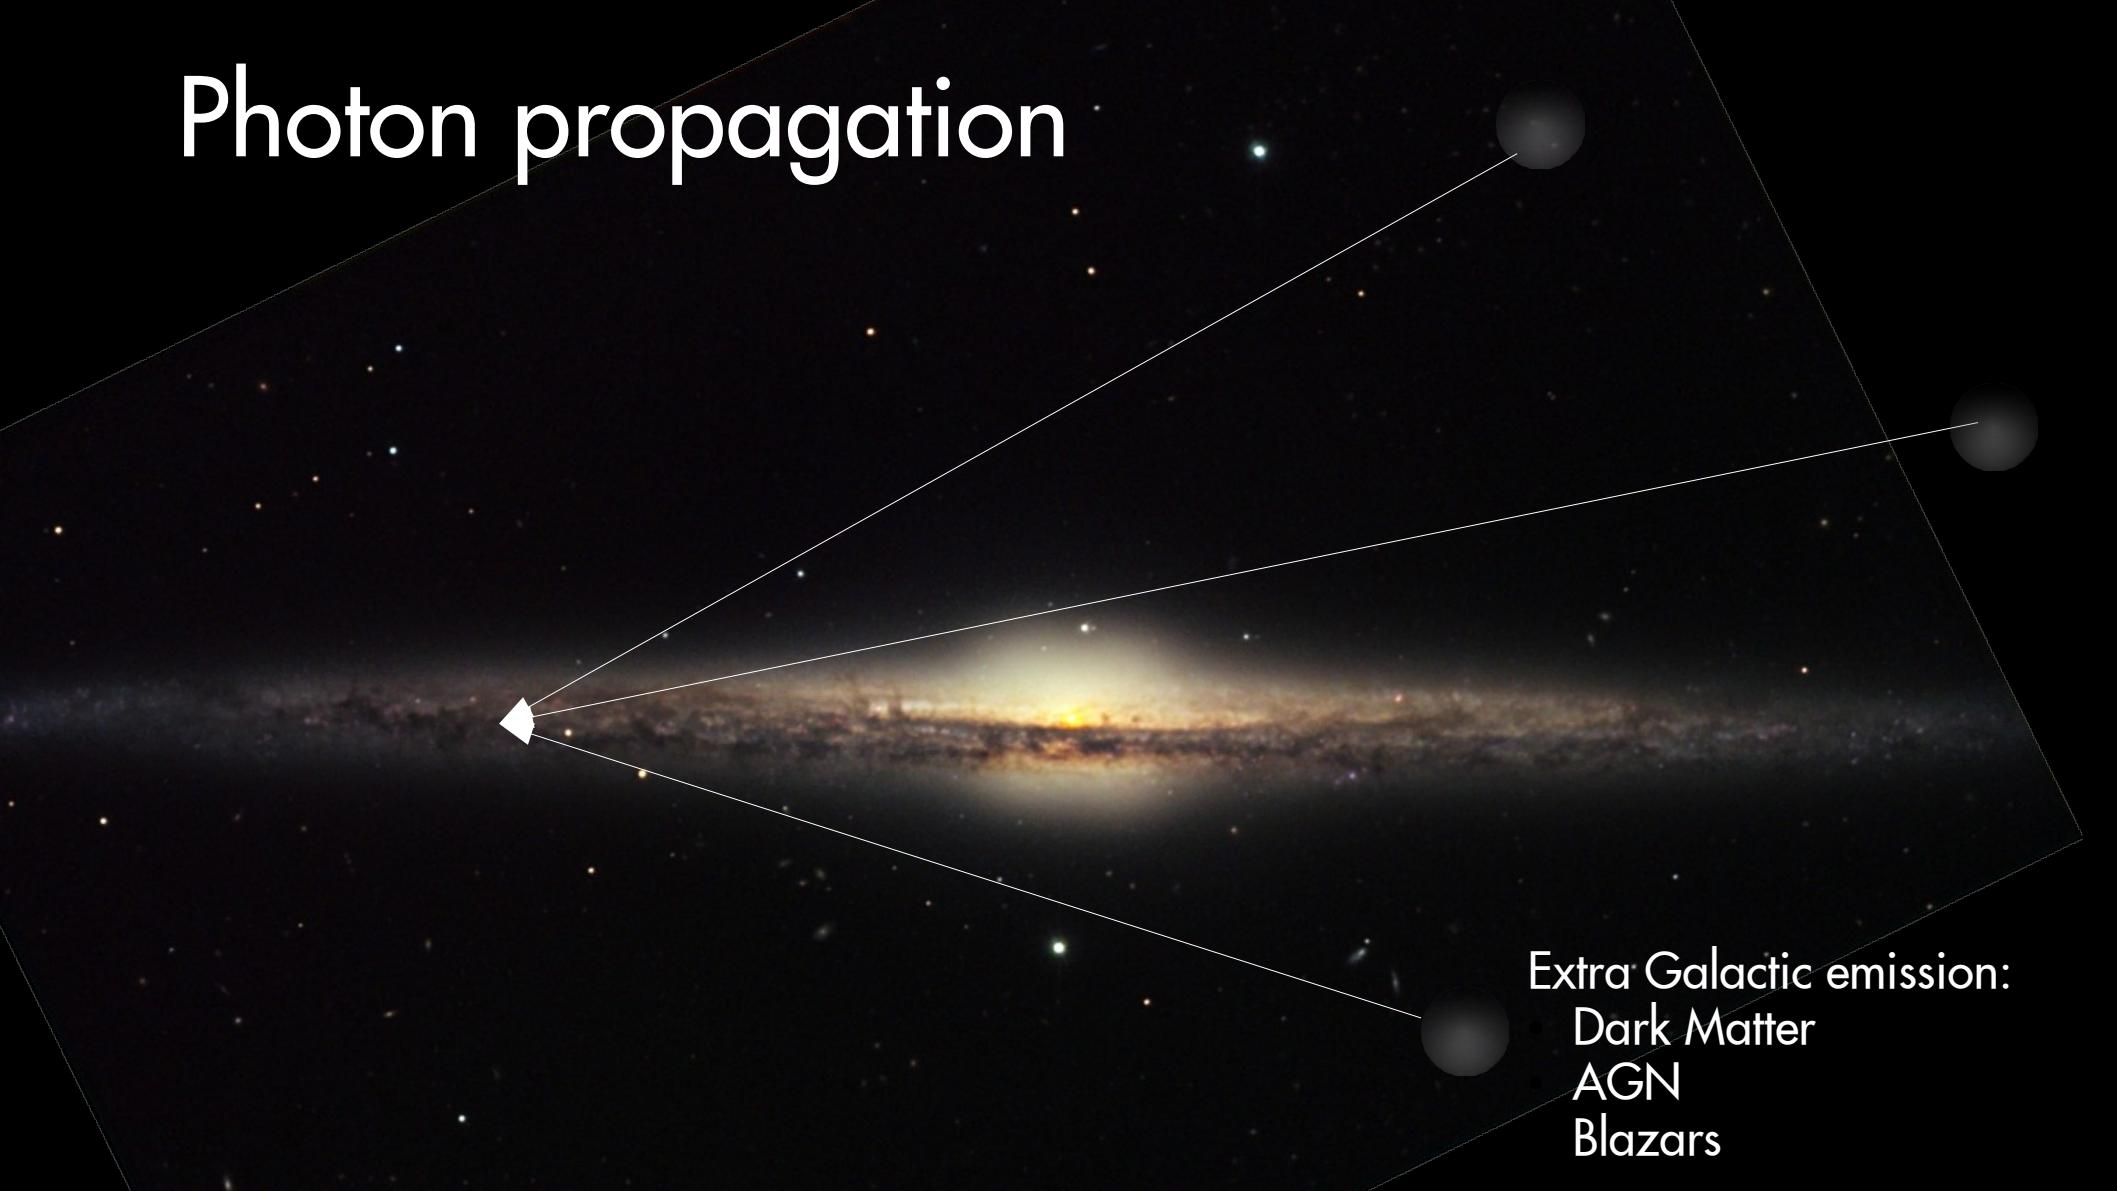

Photon propagation

Diffuse emission due to:

- Cosmic rays interaction
- Dark Matter halo

Photon propagation

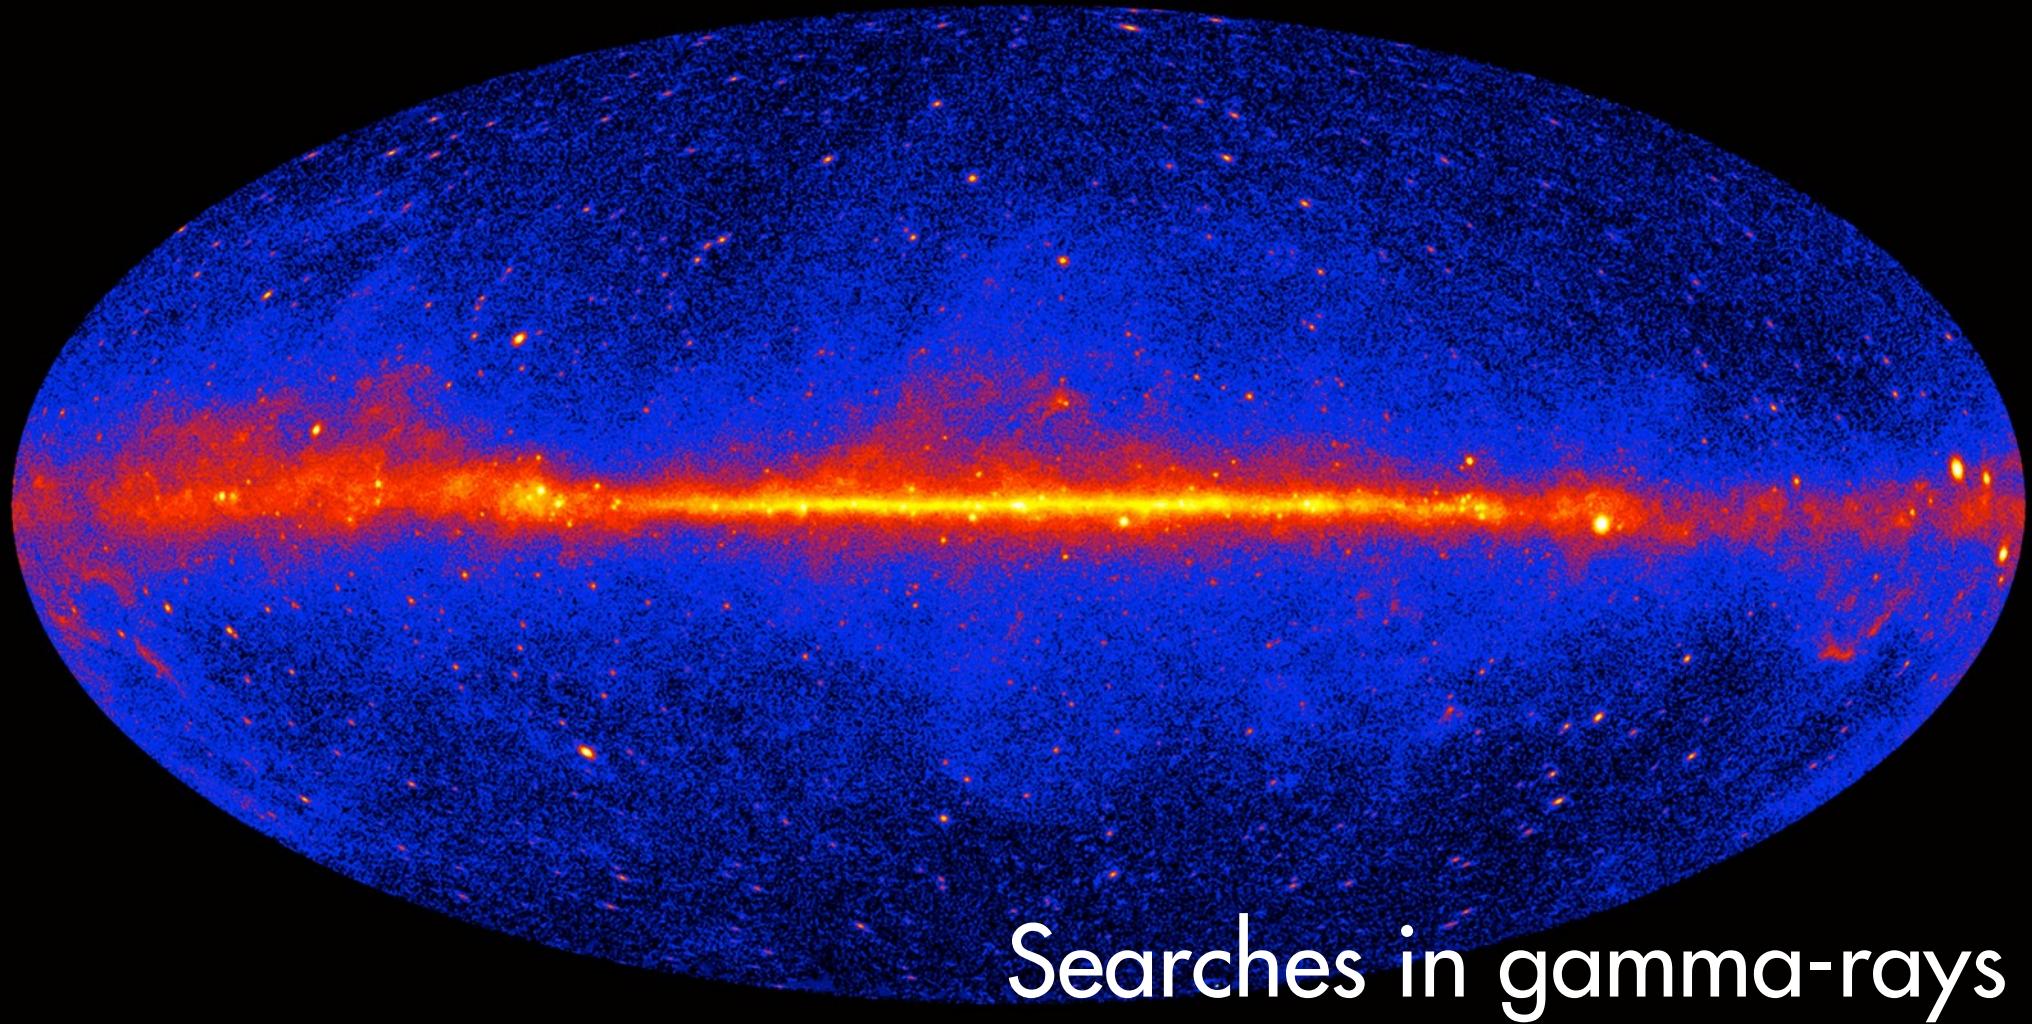

Photon flux

Since photons propagate in straight line, the flux comes from the cumulative contributions from sources

$$\frac{d\Phi}{dE} = \frac{1}{\Delta\Omega} \int d\Omega \int_{\text{l.o.s.}} \frac{s(r(l), E)}{4\pi} dl$$

In the case of Dark Matter Searches:

$$\frac{d\Phi}{dE} = \underbrace{\frac{1}{4\pi m_{\text{DM}}^2} \sum_i \langle \sigma_i v \rangle}_{\text{particle physics}} \underbrace{\frac{dN_\gamma^i}{dE} \times \frac{1}{\Delta\Omega} \int_{\Delta\Omega} d\Omega \int_{\text{l.o.s.}} \rho^2(r(l)) dl}_{\text{J-factor}}$$

Searches in gamma-rays

Gamma-ray observatories

Fermi-LAT (low orbit)
Calorimeter

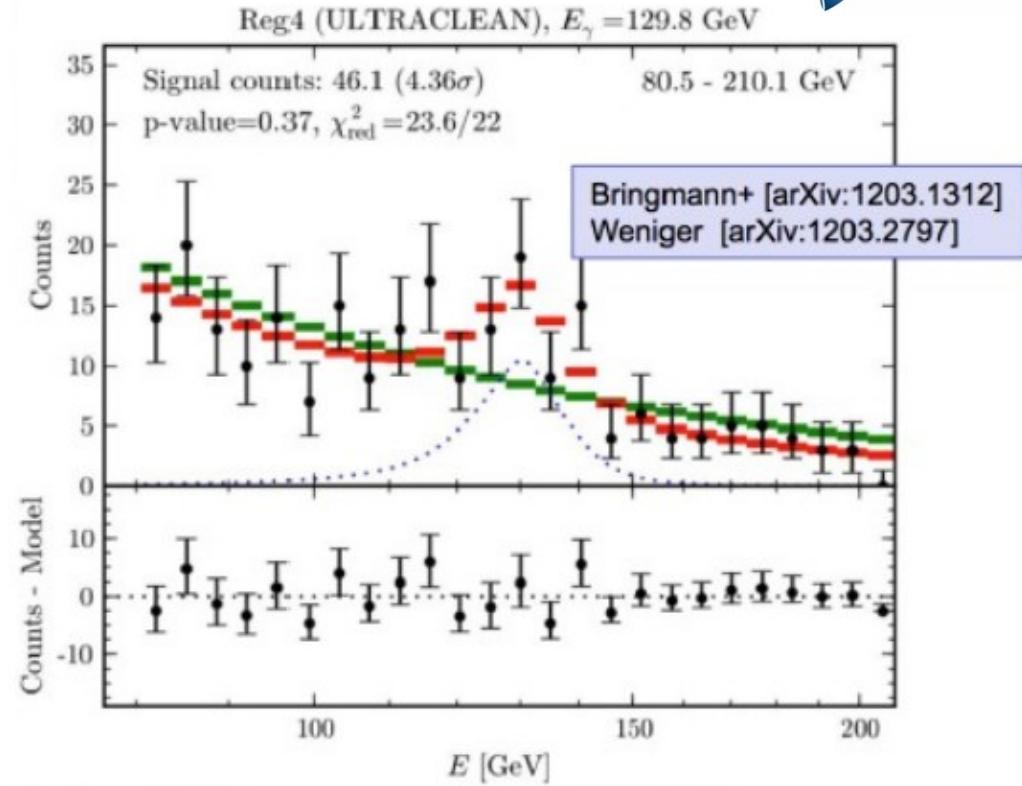

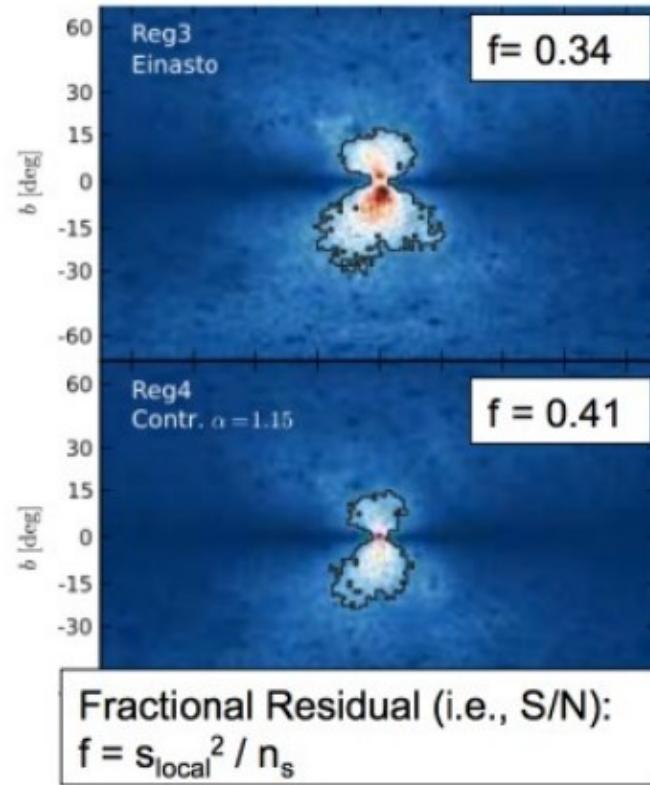

HESS (Namibia), MAGIC (Spain),
CTA (Spain and Chile)
Atmosphere Cherenkov

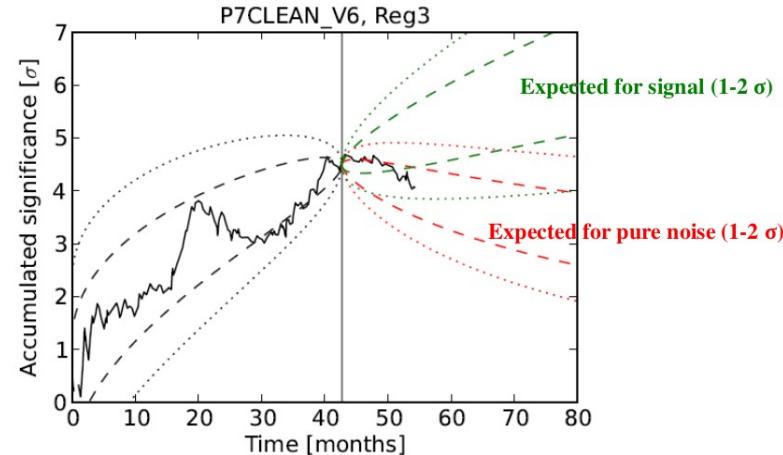

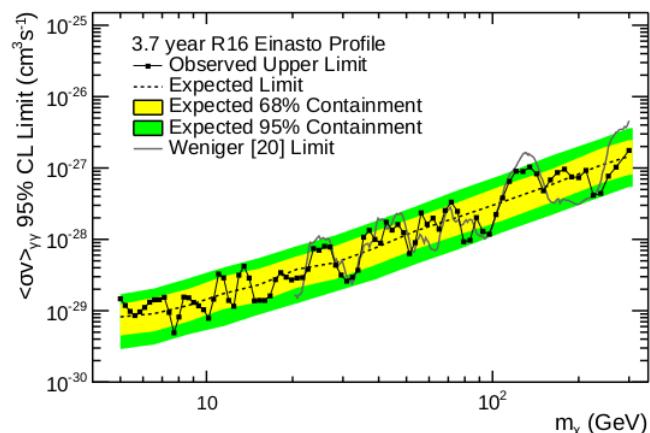

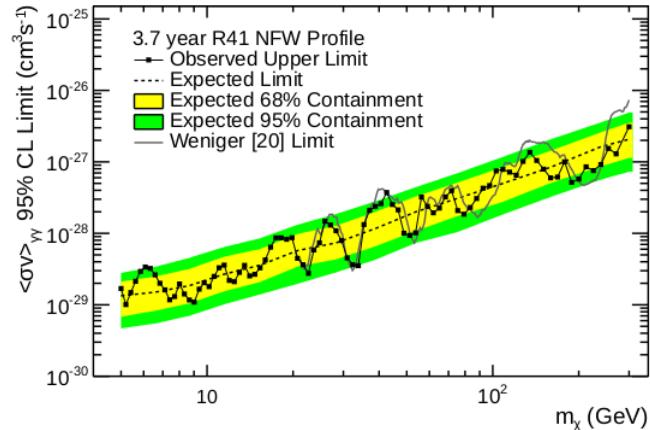

HAWC (Mexico)
Water Cherenkov

Searches in gamma rays

Tentative gamma line of 130 GeV coming from the Galactic Center

Searches in gamma rays

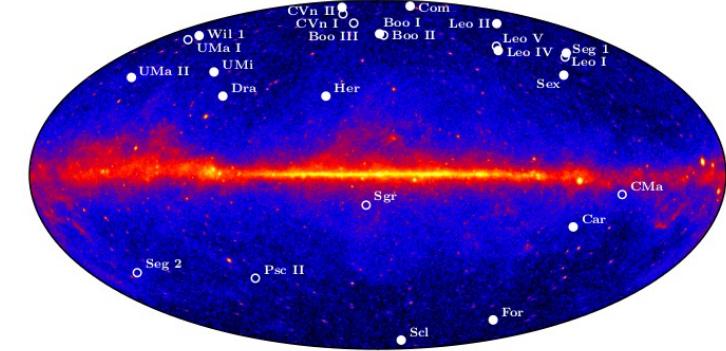

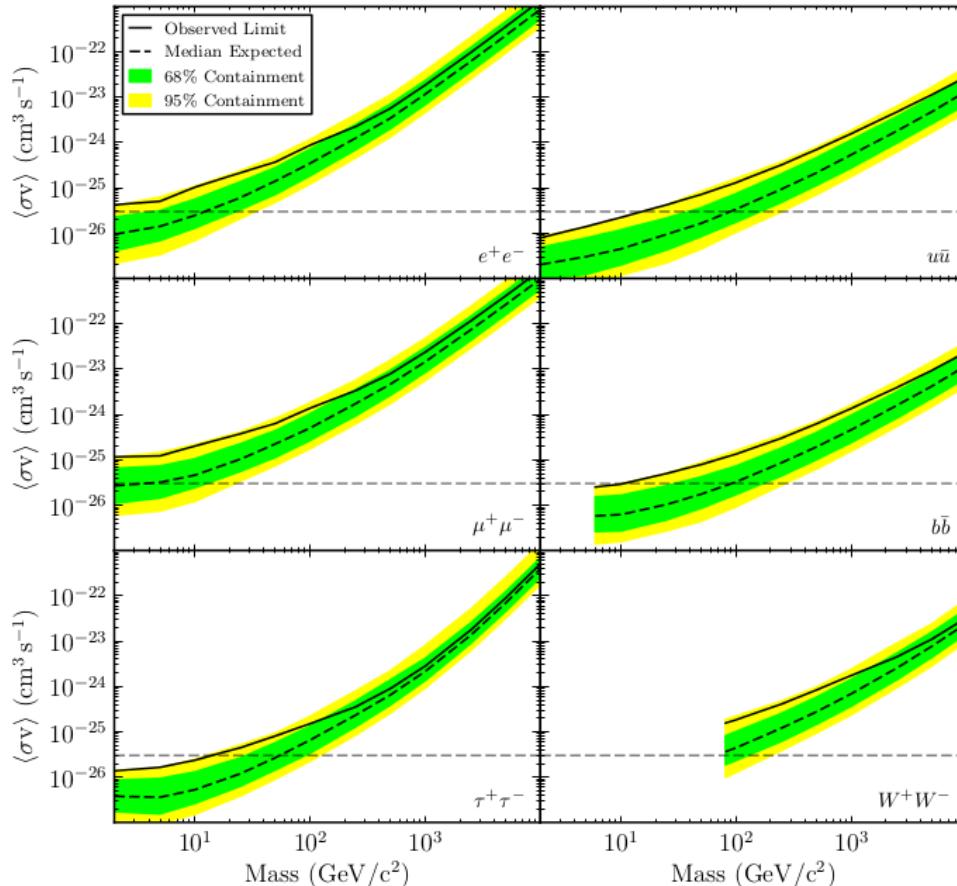

C. Weniger. arXiv:1303.1798

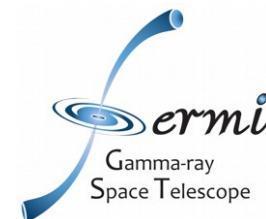

Fermi-LAT Collaboration
PRD 88, 082002 (2013). arXiv:1305.5597

Searches in gamma rays

(Dwarf Spheroidal Galaxies)

Combined analysis on 25
Dwarf Spheroidal Galaxies

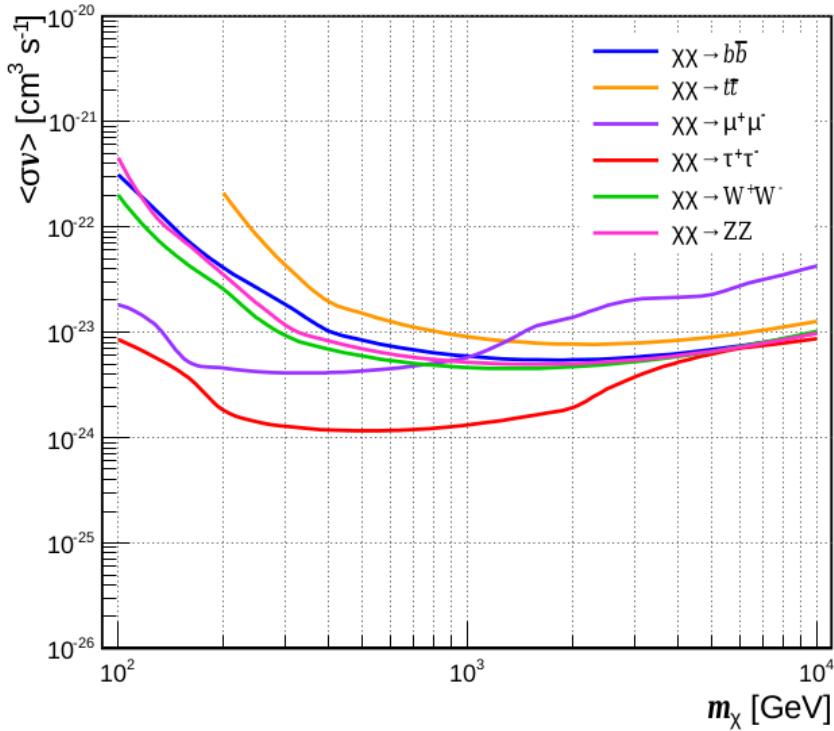

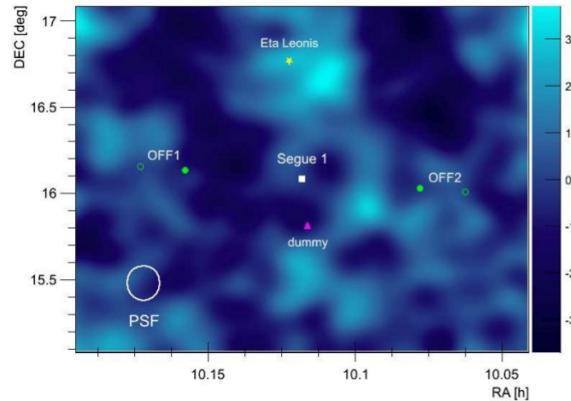

Fermi-LAT Collaboration.
arXiv:1310.0828

Searches in gamma rays

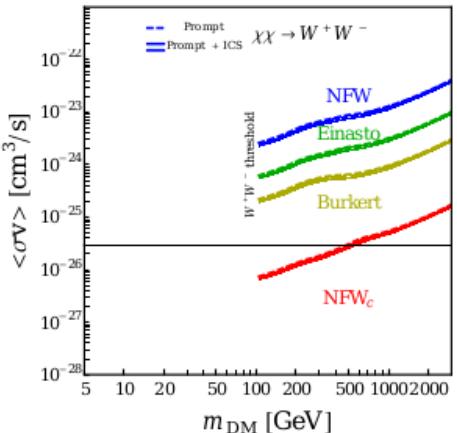

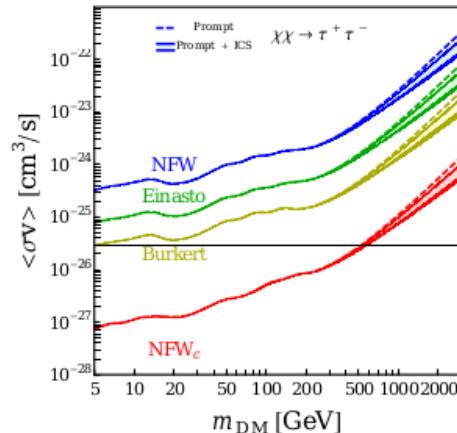

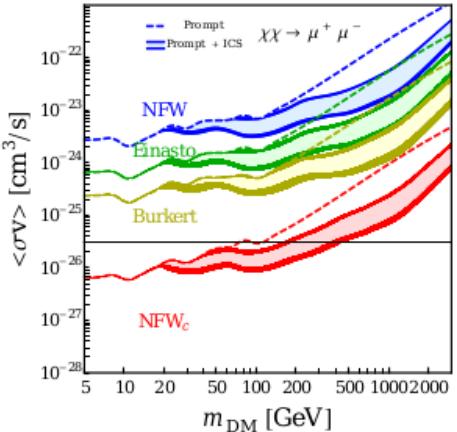

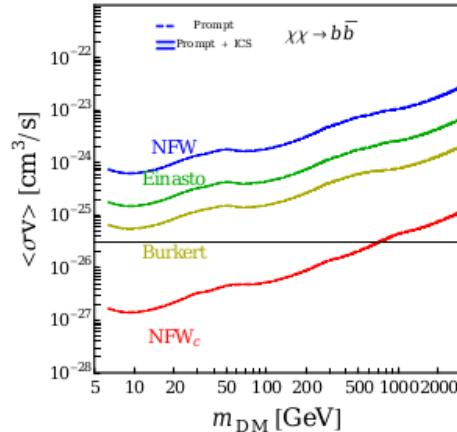

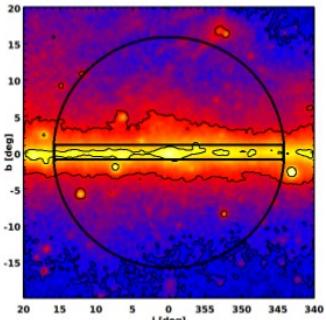

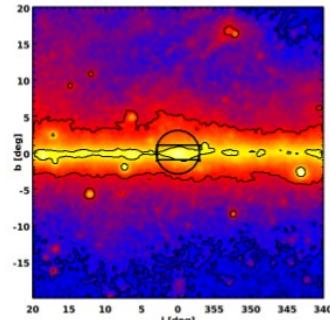

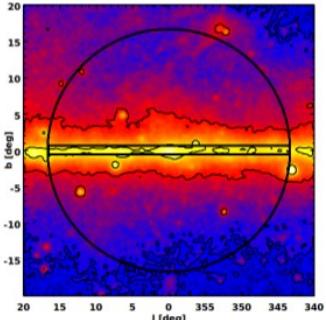

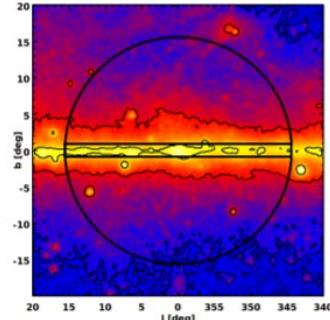

Optimized dark matter searches in deep observations of Segue 1 with MAGIC, arXiv:1312.1535

Searches in gamma rays

(Galactic Center)

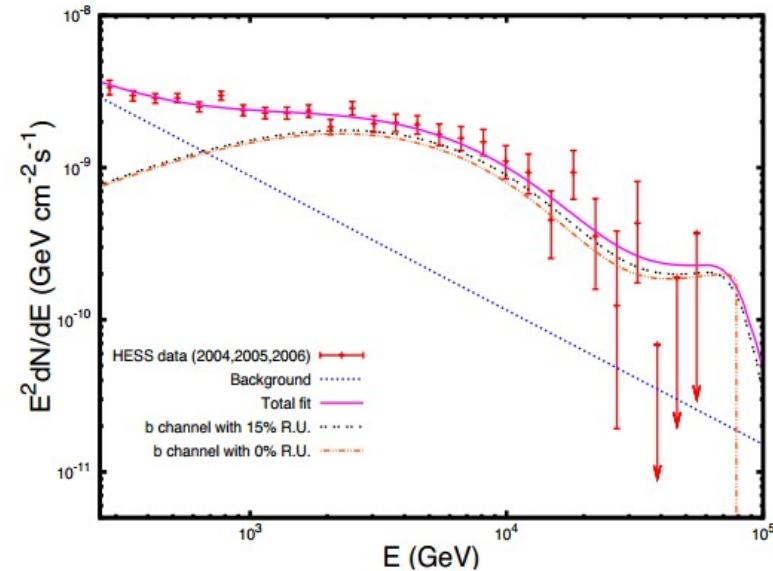

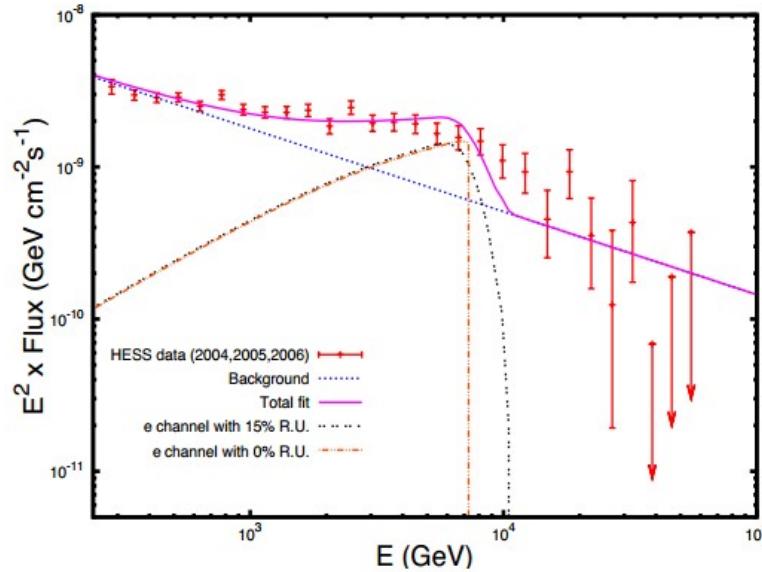

G. Gómez-Vargas et al.
JCAP10(2013)029. arXiv:1308.3515

Searches in gamma rays

(Galactic Center)

Cembranos et al.
arXiv:1302.6871

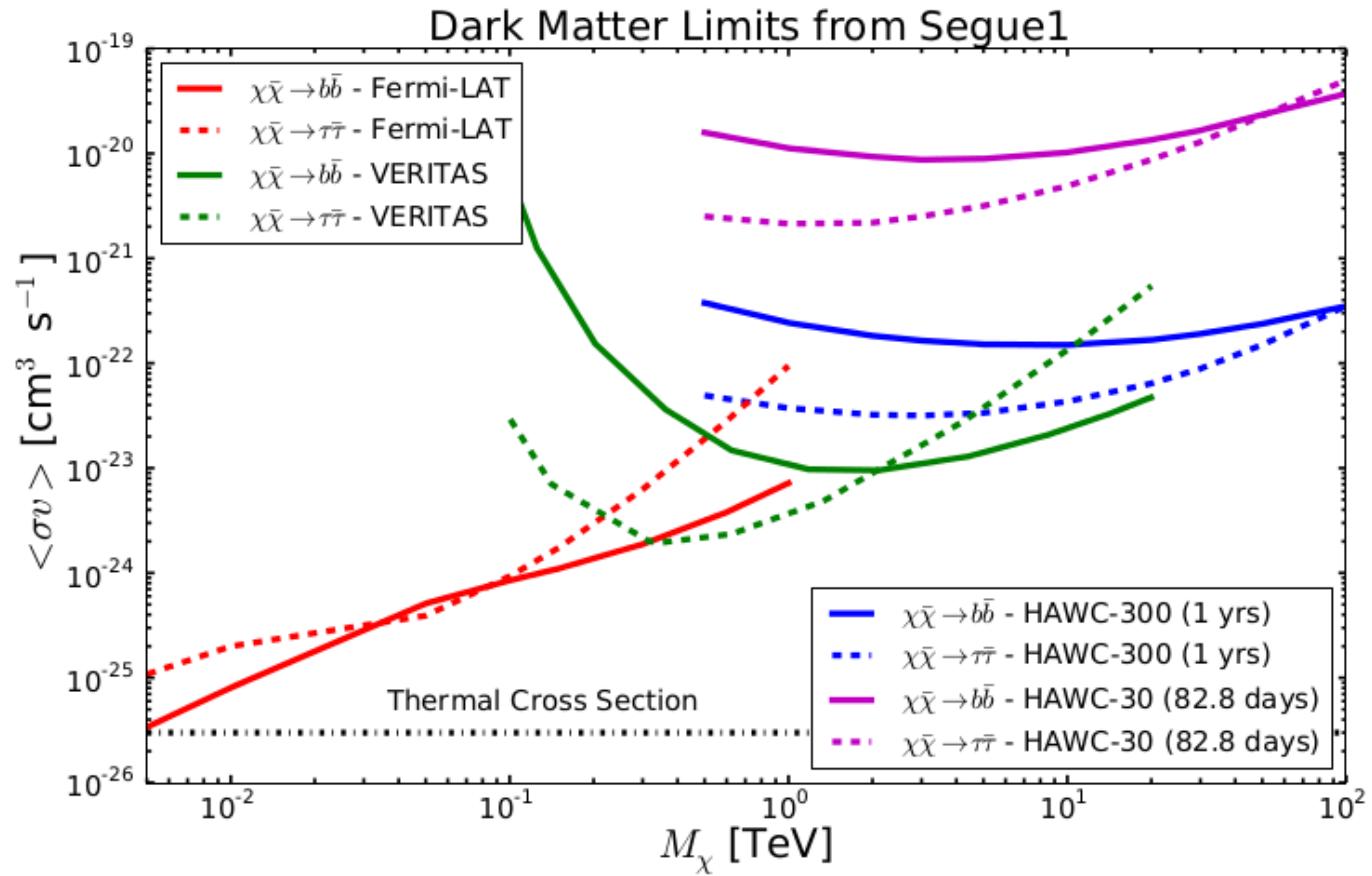

Observation done with HESS indicate a signal compatible with DM at the TeV range

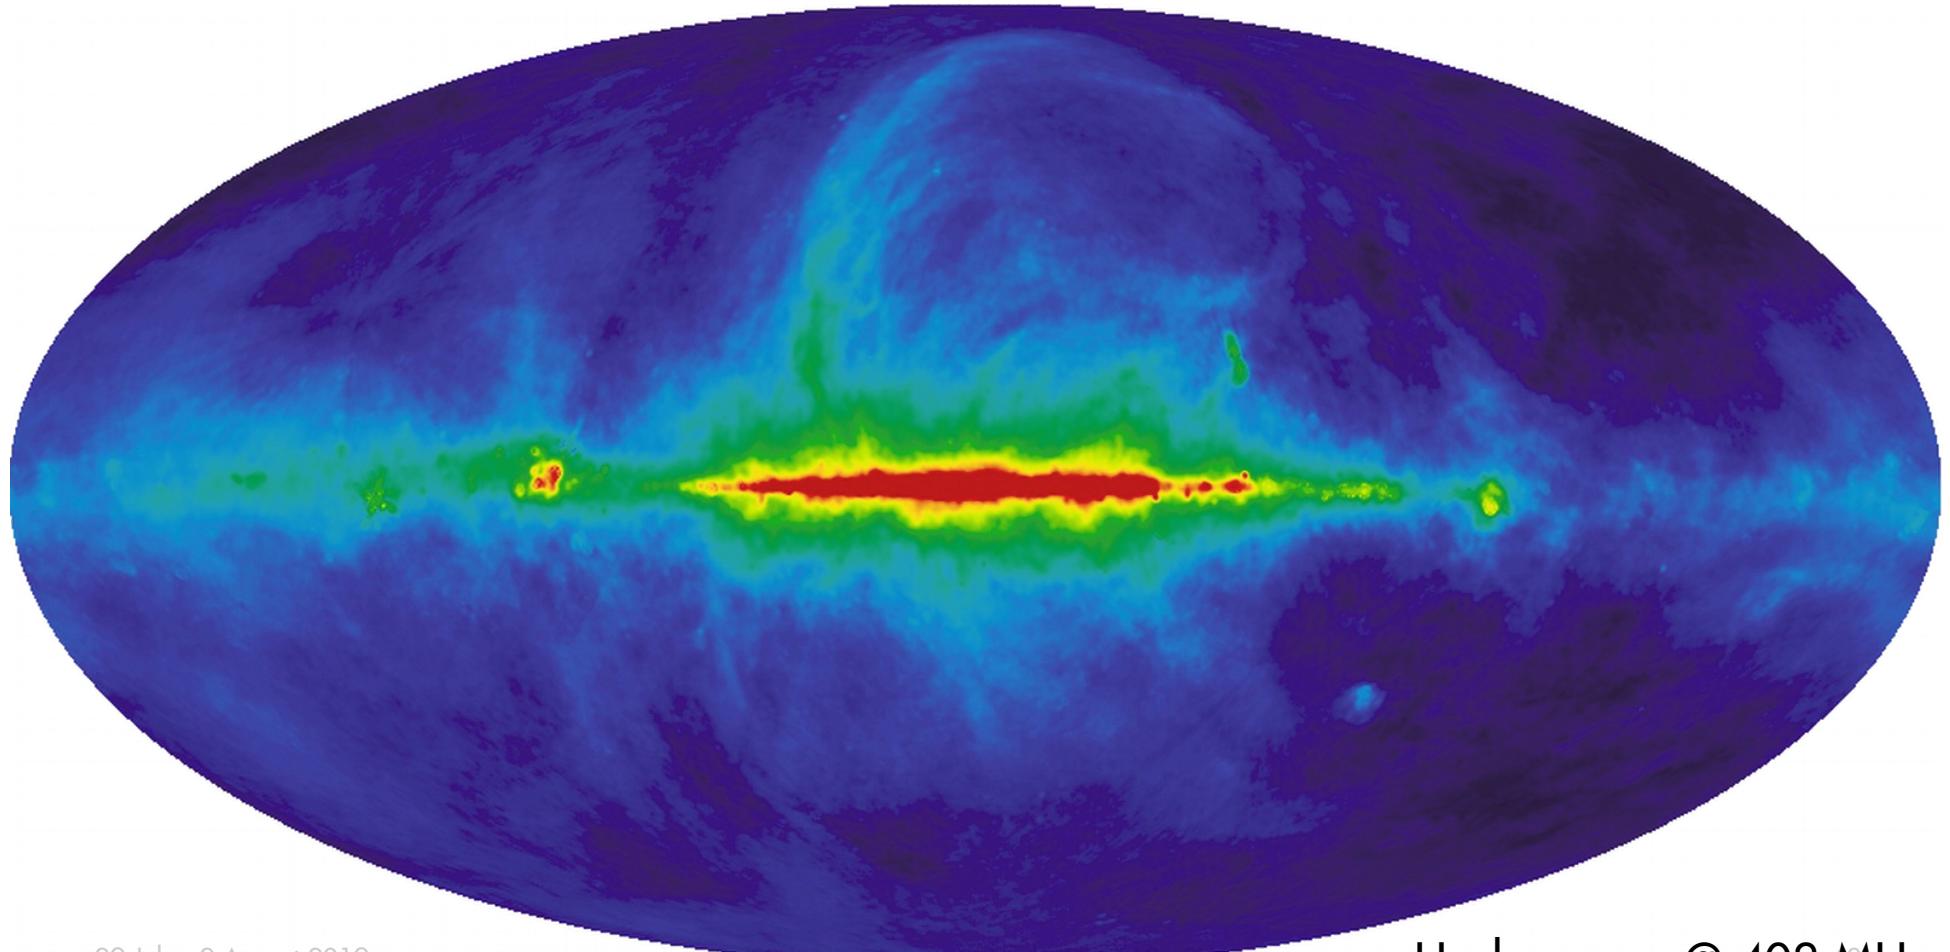

Searches in gamma rays

HAWC Collab. ICRC 2013
arXiv:1310.0073

Synchrotron radiation

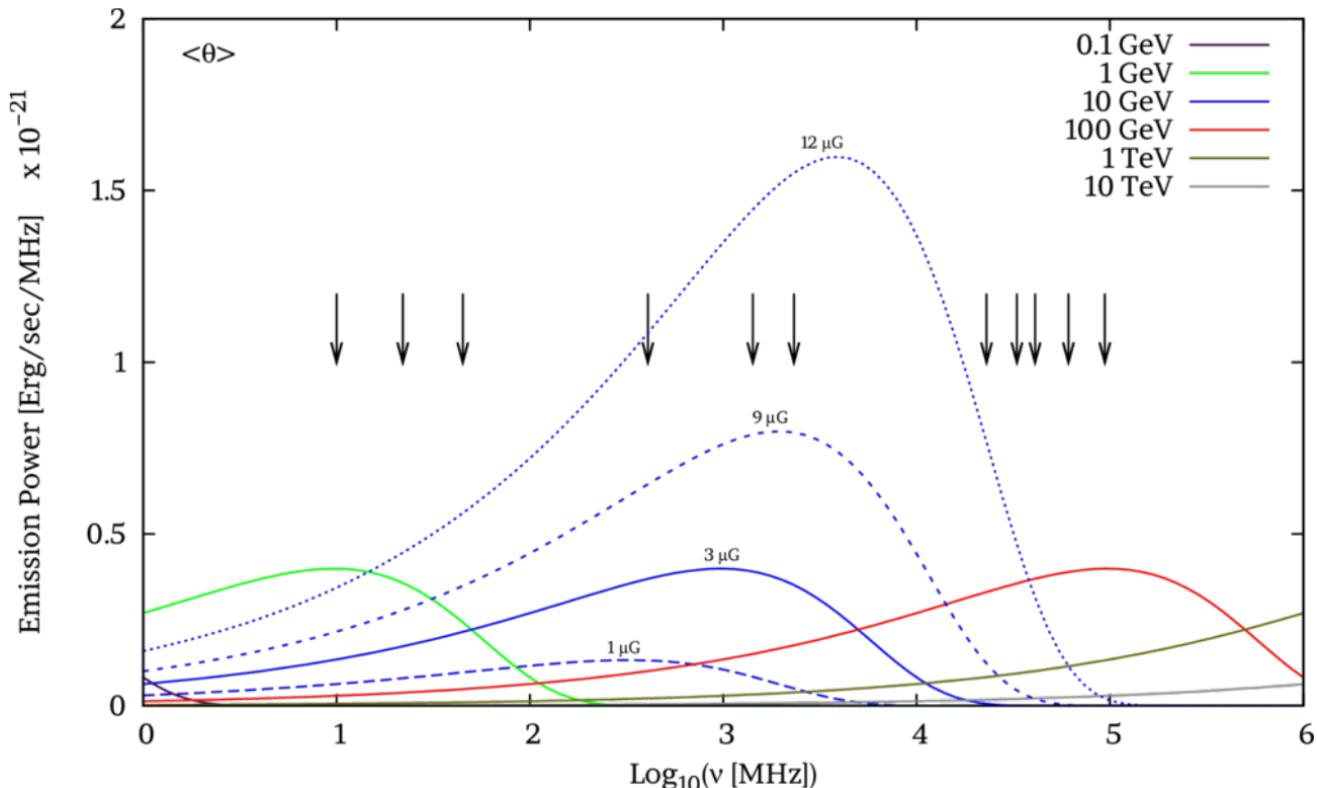

29 July - 2 August 2019

R. A. Ekers et al., MNRAS, 2019, 000, 1–100

Haslam map @ 408 MHz

Synchrotron radiation

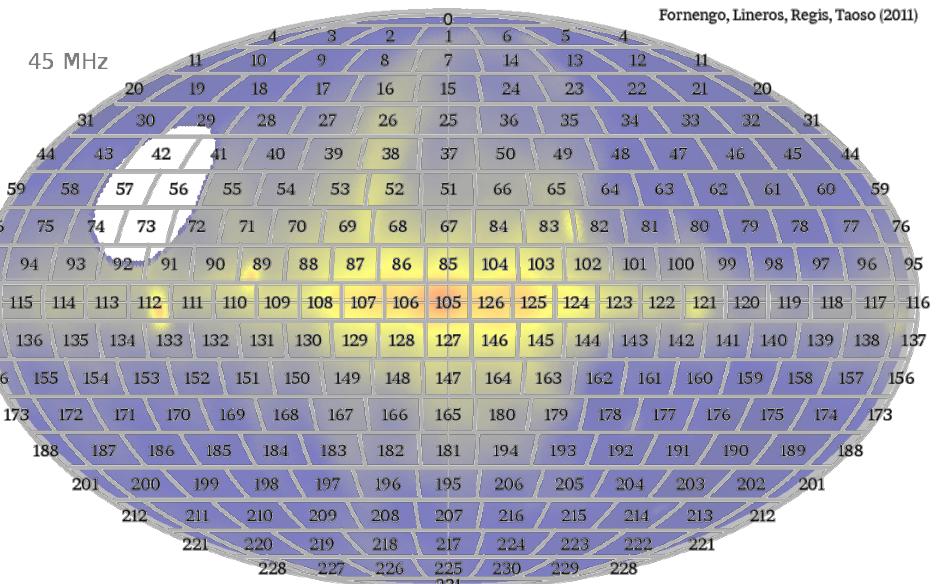

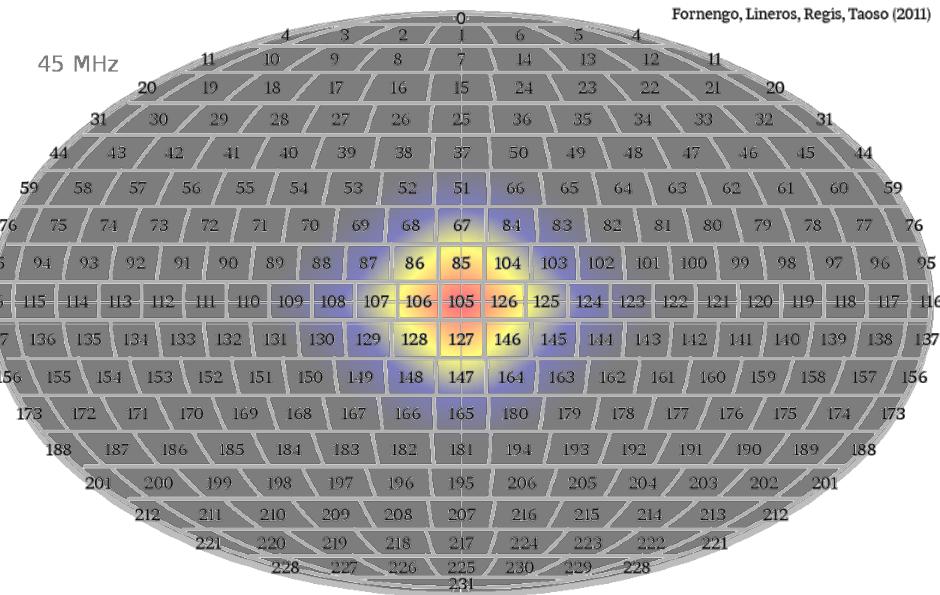

$$\frac{dw}{d\nu}(\nu, B_{\perp}) = \frac{\sqrt{3} e^3 B_{\perp}}{m_e c^2} F\left(\frac{\nu}{\nu_{c,\perp}}\right)$$

$$\nu_{c,\perp} = \frac{3eB_{\perp}E^2}{4\pi m_e^3 c^5}$$

$$F(x) = x \int_x^{\infty} d\zeta K_{5/3}(\zeta)$$

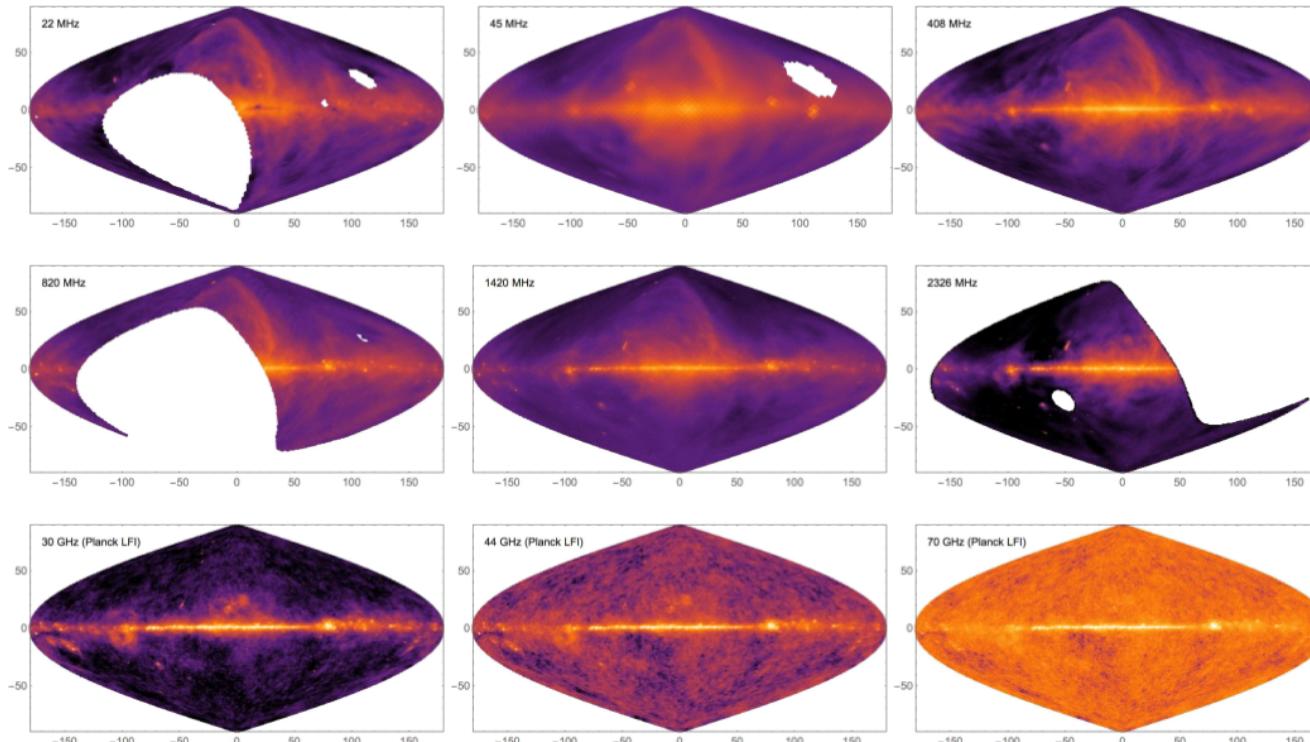

Galactic DM radio emission

$$T_{\text{DM}} \leq T_{\text{obs}} + 3\sigma$$

Conservative: direct comparison Obs and DM
 Progressive: (astro) galactic emission included

Galactic DM radio emission

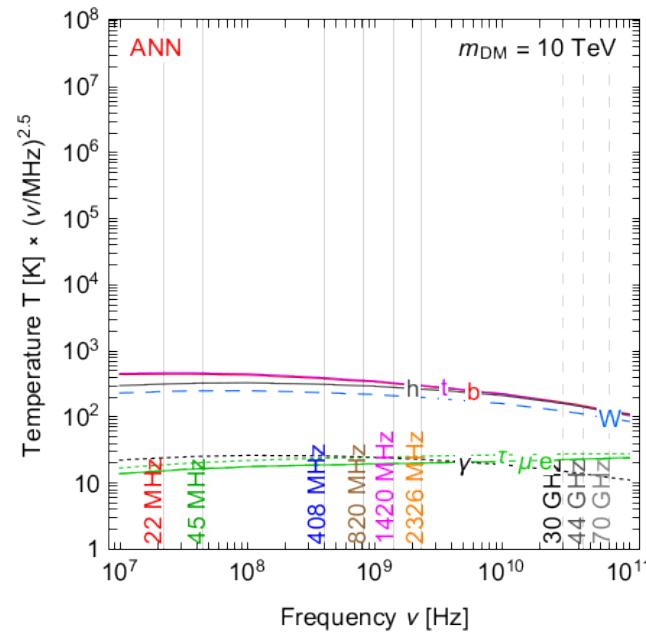

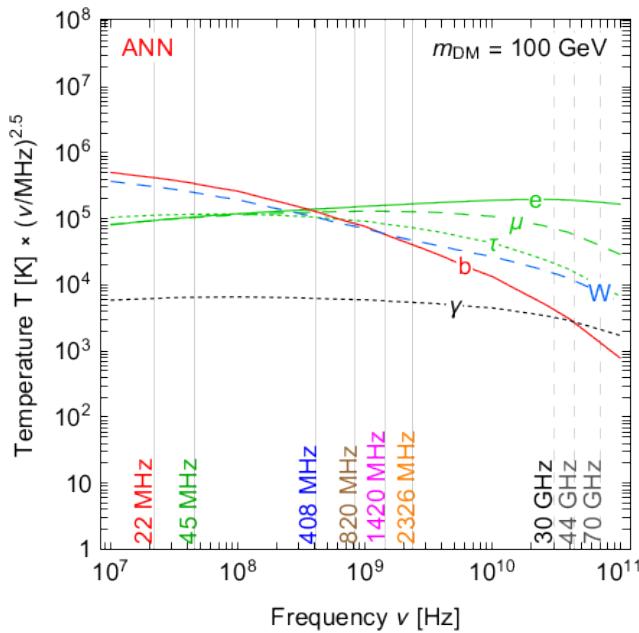

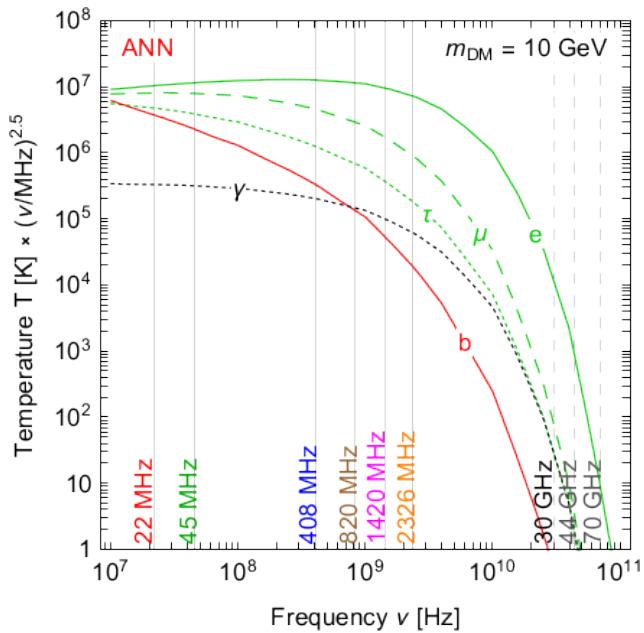

9 data sets

From 22 MHz to 70 GHz

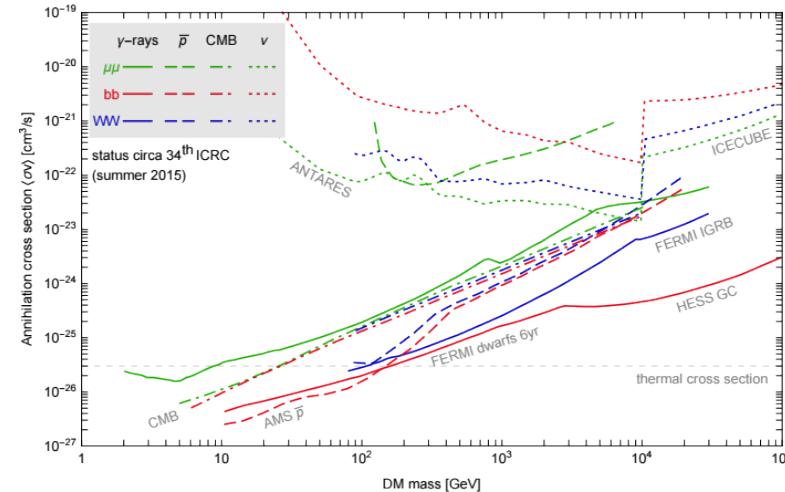

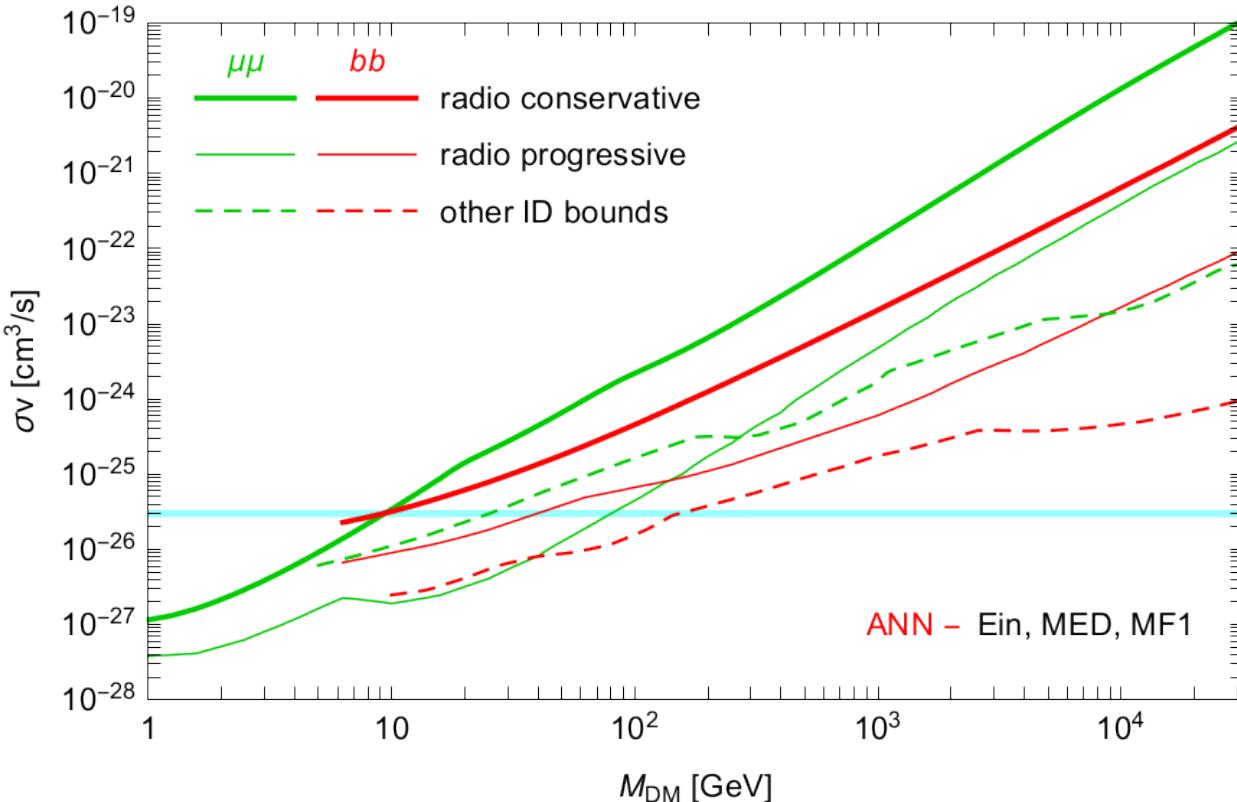

Frequency	Source and Reference	Sky coverage
22 MHz	Roger et al. [38]	73%
45 MHz	Guzman et al. [39]	96%
408 MHz	Haslam et al. [40]	100%
820 MHz	Berkhuijsen [41]	51%
1420 MHz	Reich et al. [42–44]	100%
2326 MHz	Jonas et al. [45]	97%
30 GHz	PLANCK-LFI [46]	100%
44 GHz	PLANCK-LFI [46]	100%
70 GHz	PLANCK-LFI [46]	100%

Galactic DM radio emission

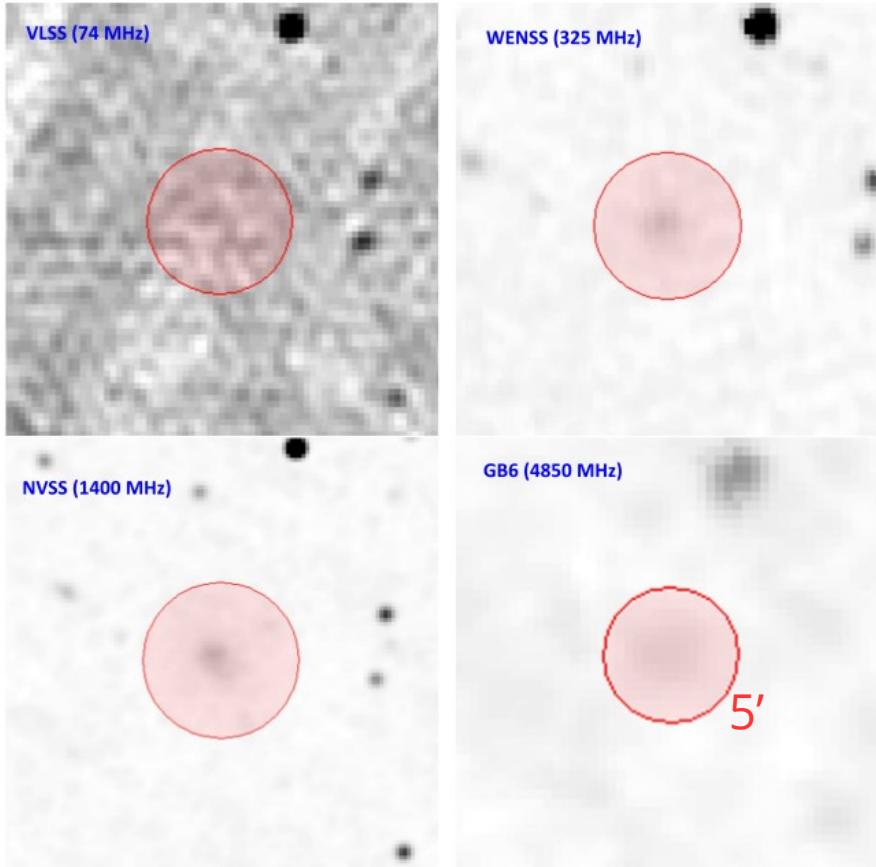

DM mass and annihilation spectra reveals the multi-frequency constraining capability

Galactic DM radio emission

The constraints improve in the progressive scheme

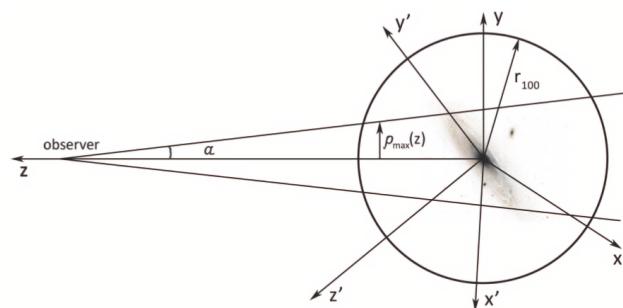

DM radio emission in M31

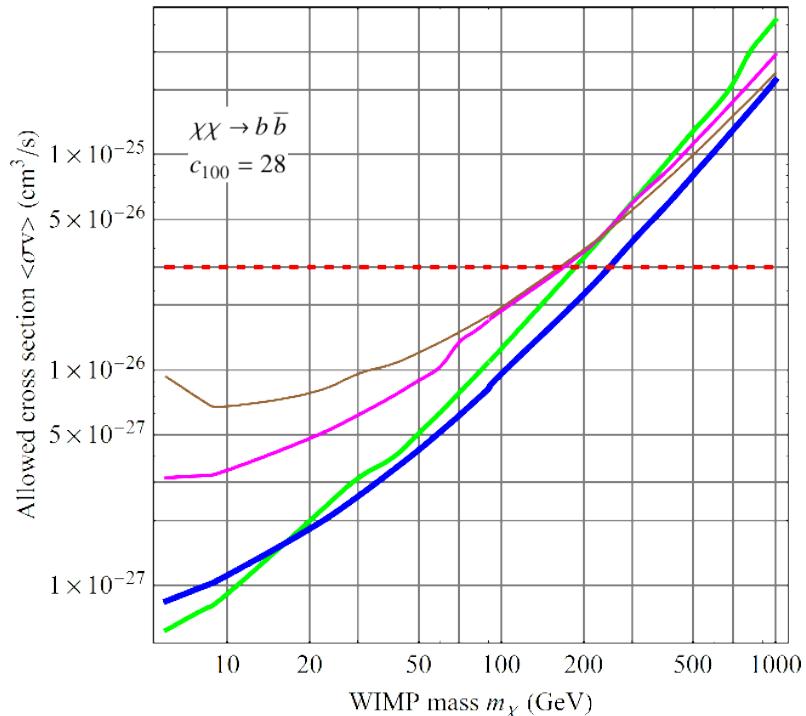

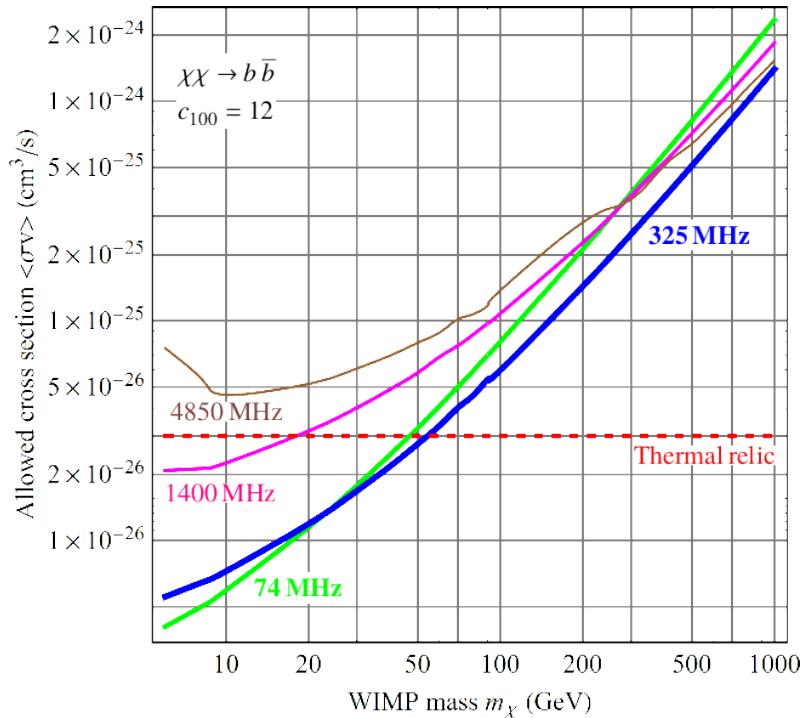

M31 is expected to be very similar to the Milky Way

Analysis based on the central region of M31 at frequencies:

74, 325, 1400, and 4850 MHz

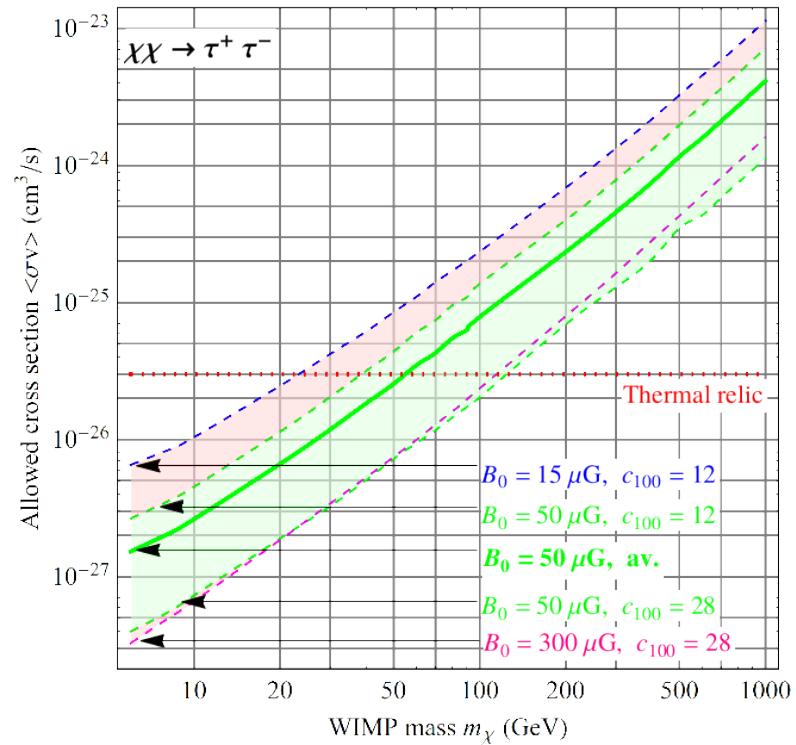

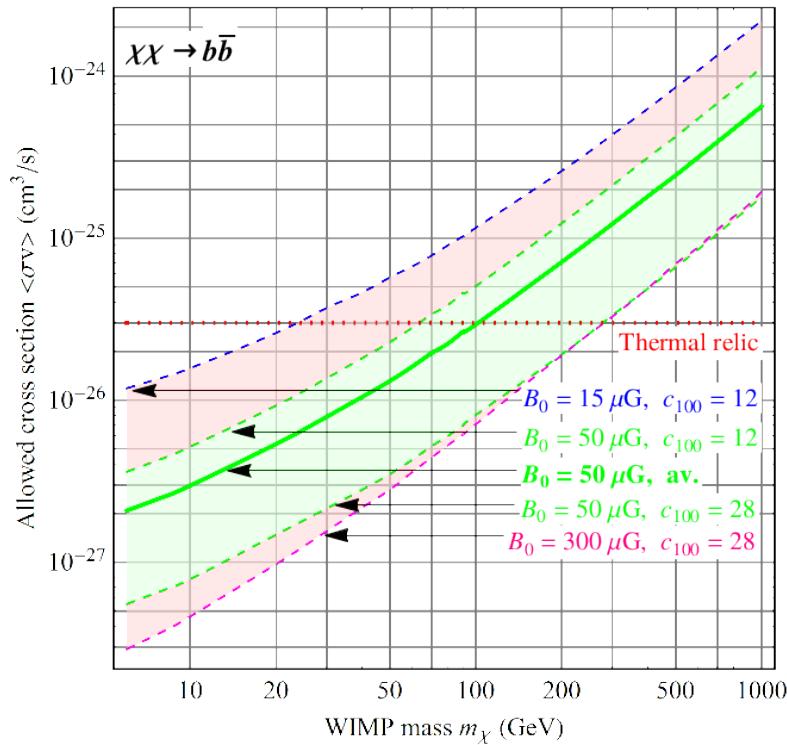

DM radio emission in M31

The concentration value c_{100} has a big impact in the overall signal

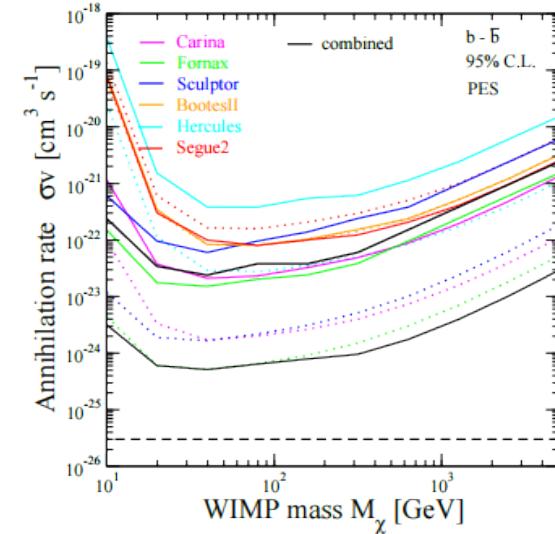

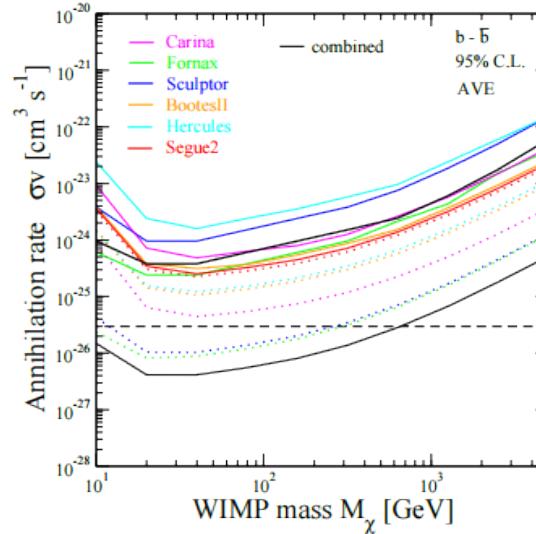

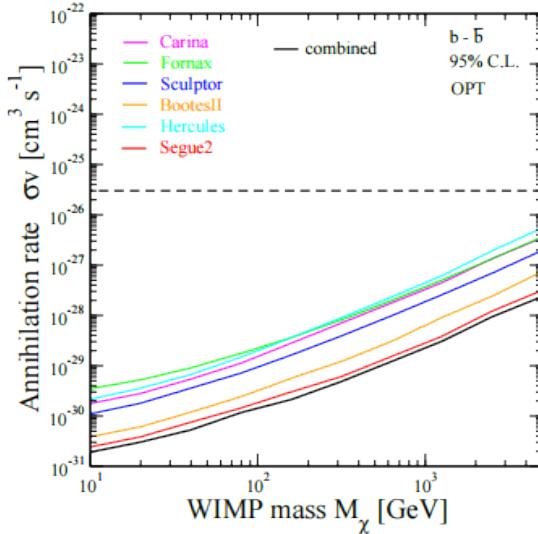

DM radio emission in M31

After including uncertainties from DM distribution and magnetic field

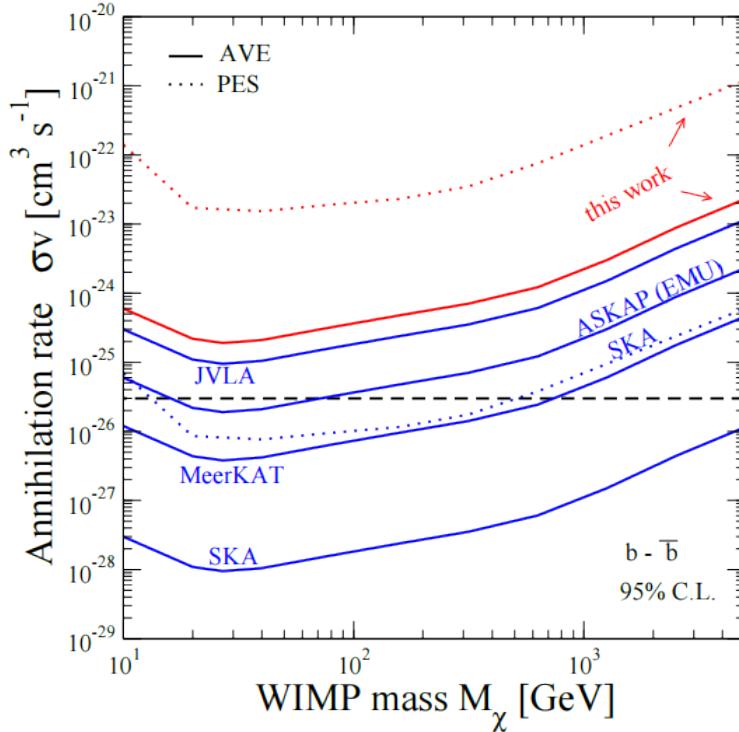

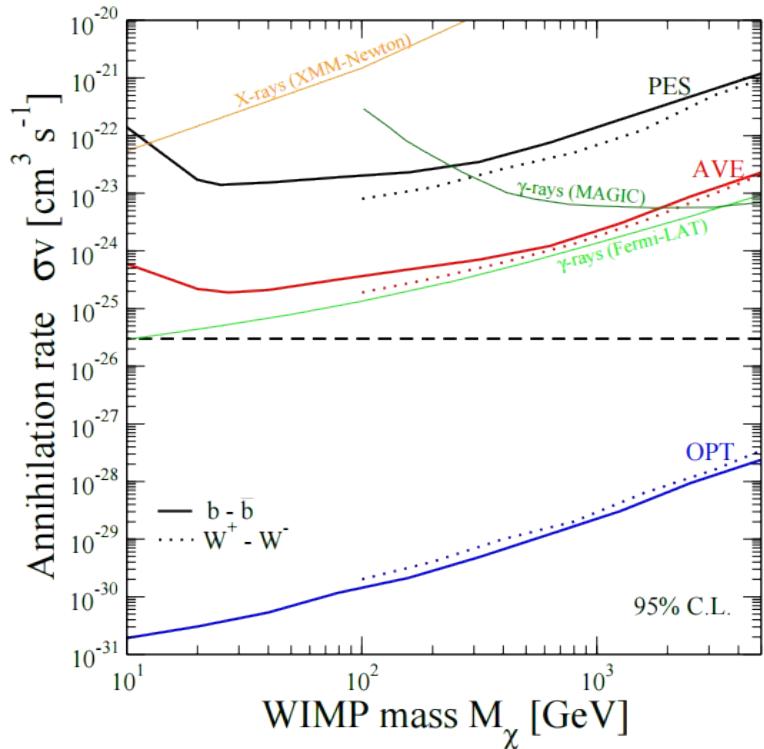

Radio from dSph using ATCA

Name	magnetic field	diffusion scheme	DM profile
OPT	B_{eq}^{obs}	loss-at-injection	Einasto
AVE	$\max(B_{SFR}, 1 \mu\text{G})$	$D = 3 \cdot 10^{28} (E/\text{GeV})^{0.3} \exp(r/r_*) \text{ cm}^2/\text{s}$	NFW
PES	B_{SFR_0}	$D = 10^{30} (E/\text{GeV})^{0.3} \exp(r/r_*) \text{ cm}^2/\text{s}$	Burkert

Observation at 16cm over 6 dSph. 3 assumptions. :-), :-|, and :-(|

Radio from dSph using ATCA

Constraints from dSph could be very strong with future observation like SKA

The Smith's Cloud

image: NRAO, Wikipedia

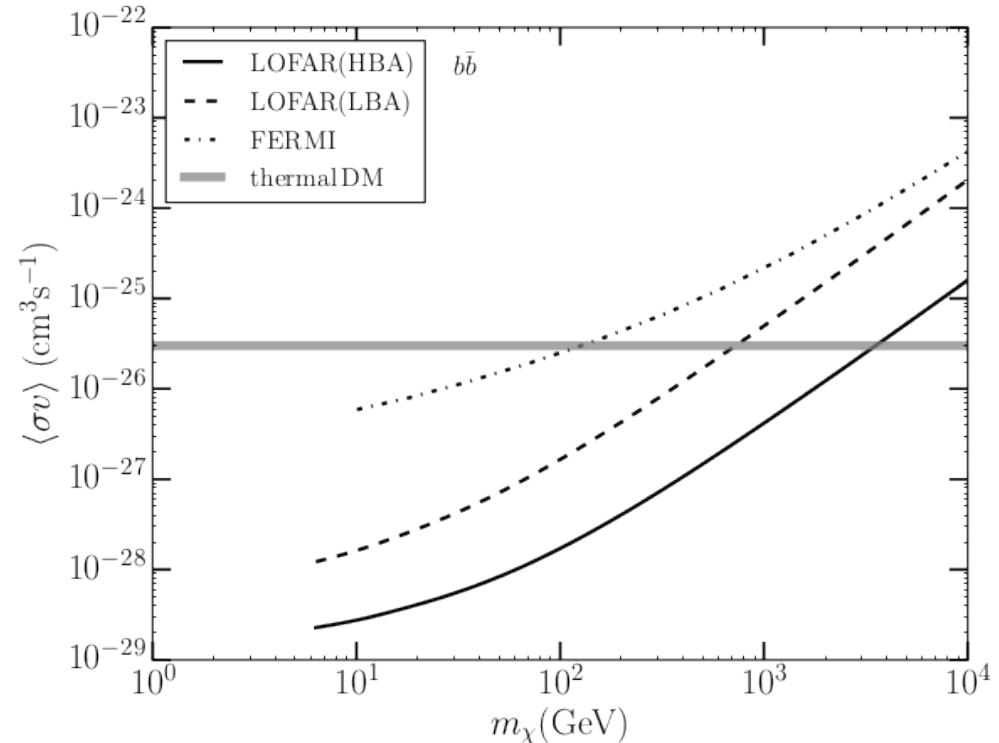

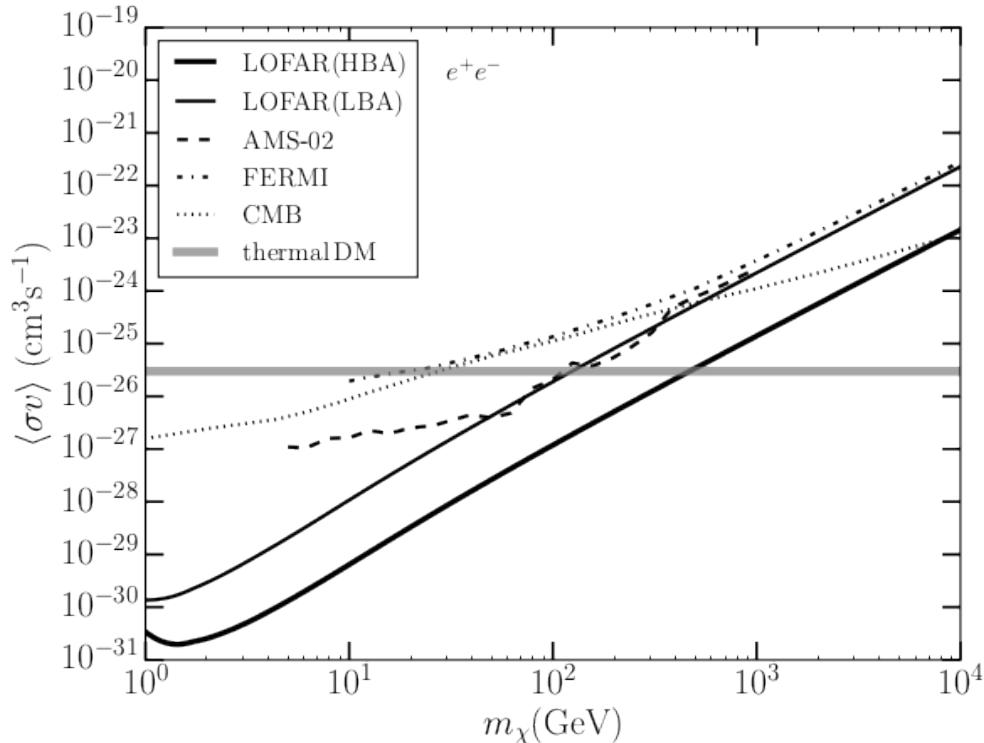

A. Drlica-Wagner et al. 1405.1030

SUMMARY OF SMITH CLOUD DARK MATTER HALO PARAMETERS.

Profile	r_s (kpc)	ρ_0 ($M_\odot \text{ kpc}^{-3}$)	M_{tidal} (M_\odot)	J-factor ($\text{GeV}^2 \text{ cm}^{-5} \text{ sr}$)
NFW	1.04	3.7×10^7	1.1×10^8	9.6×10^{19}
Burkert	1.04	3.7×10^7	1.3×10^8	4.2×10^{18}
Einasto	1.04	9.2×10^6	2.0×10^8	1.8×10^{20}

High Velocity Cloud (hydrogen) at ~ 12.4 kpc from Sun ~ 2.9 kpc below the Galactic Plane

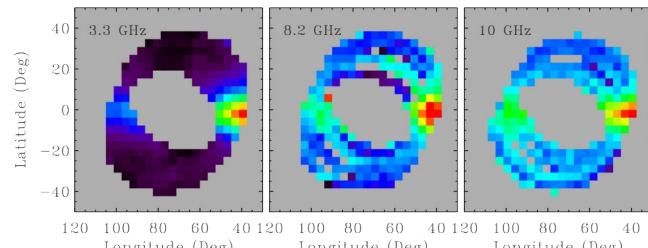

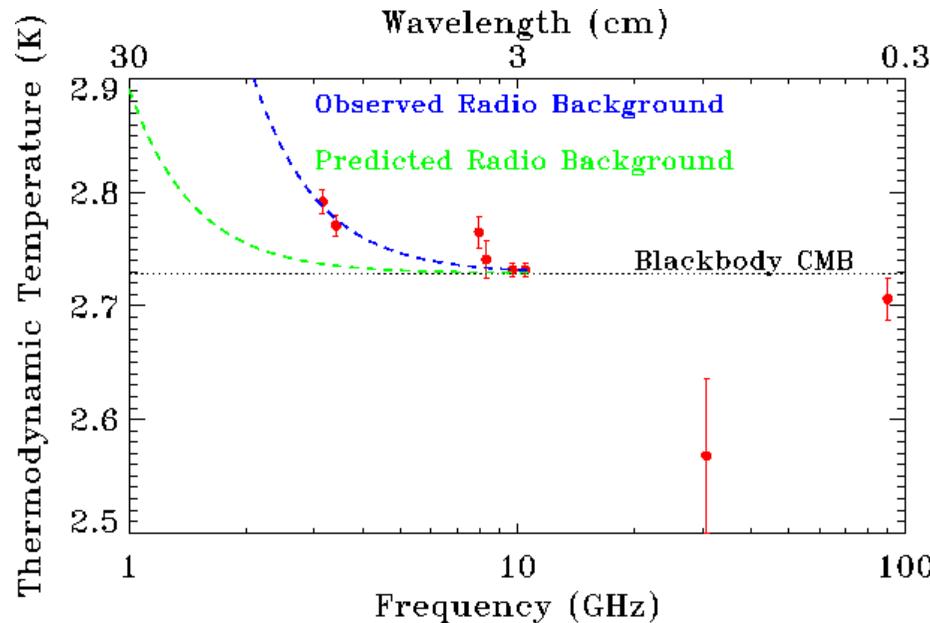

The Smith's Cloud

Projected LOFAR limits for 8hrs observation time. LBA = 60 MHz, HBA = 150 MHz

Isotropic radio background

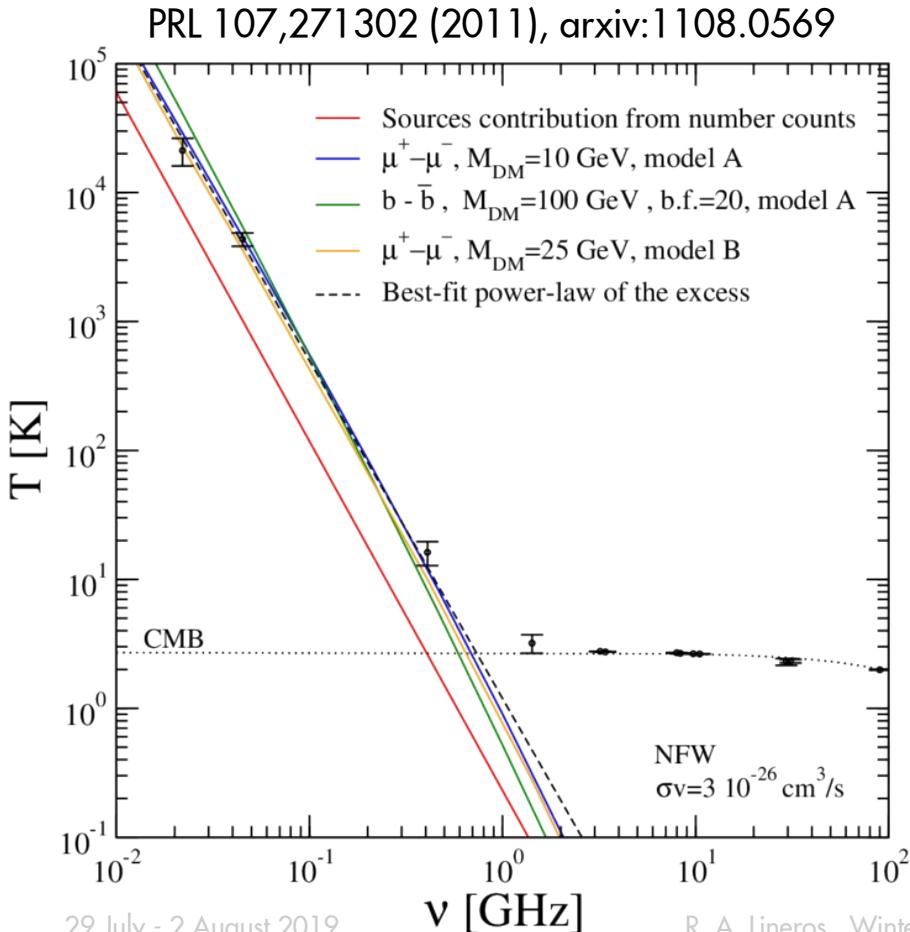

They have reported an excess in the radio background which is bigger than the expected with known sources

$$T_{sky}(\nu, \alpha, \delta) = T_{cmb}(\nu) + T_{gal}(\nu, \alpha, \delta) + \underline{T_{UERS}(\nu)}$$

Firxen et al. 0901.0555
Seiffert et al. 0901.0559

Isotropic radio background

DM can provide the missing signal

Alternative explanations

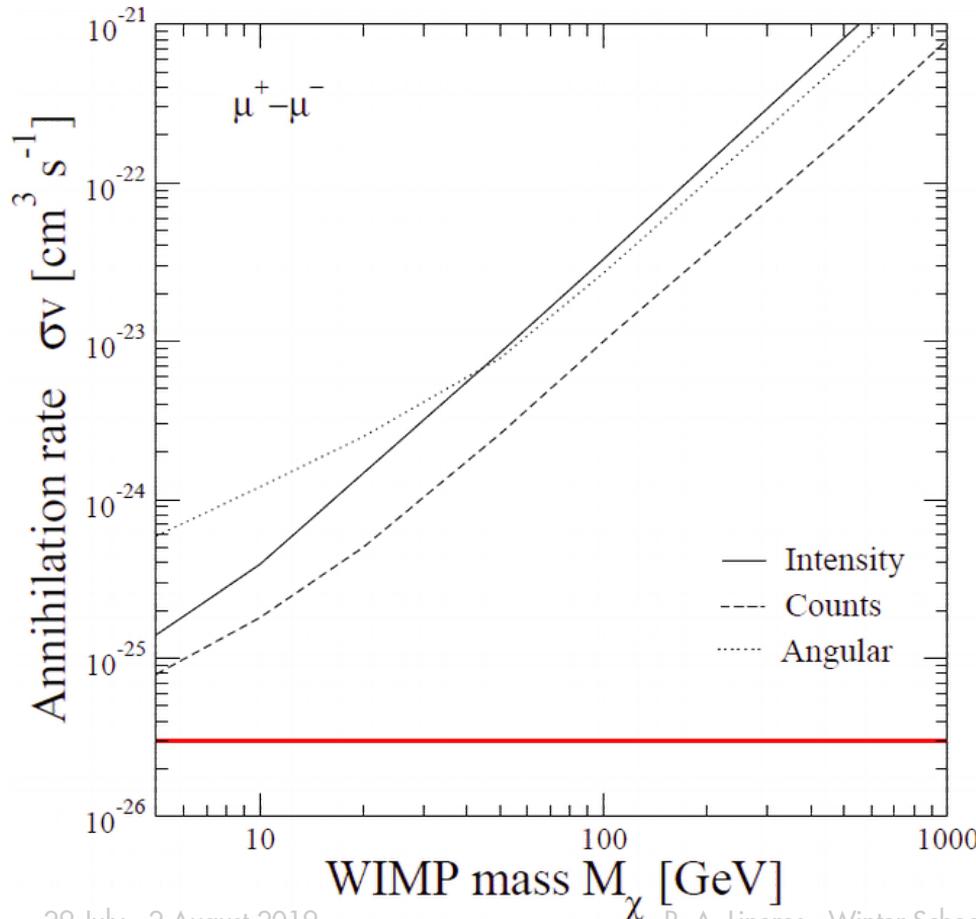

- Faint quasars
- Radio-quite AGNs
- Star forming galaxies
- Unresolved galactic sources(?)

More details:

Gervasi et al. arxiv:0803.4138
Singal et al. arxiv:0909.1997

Isotropic radio background

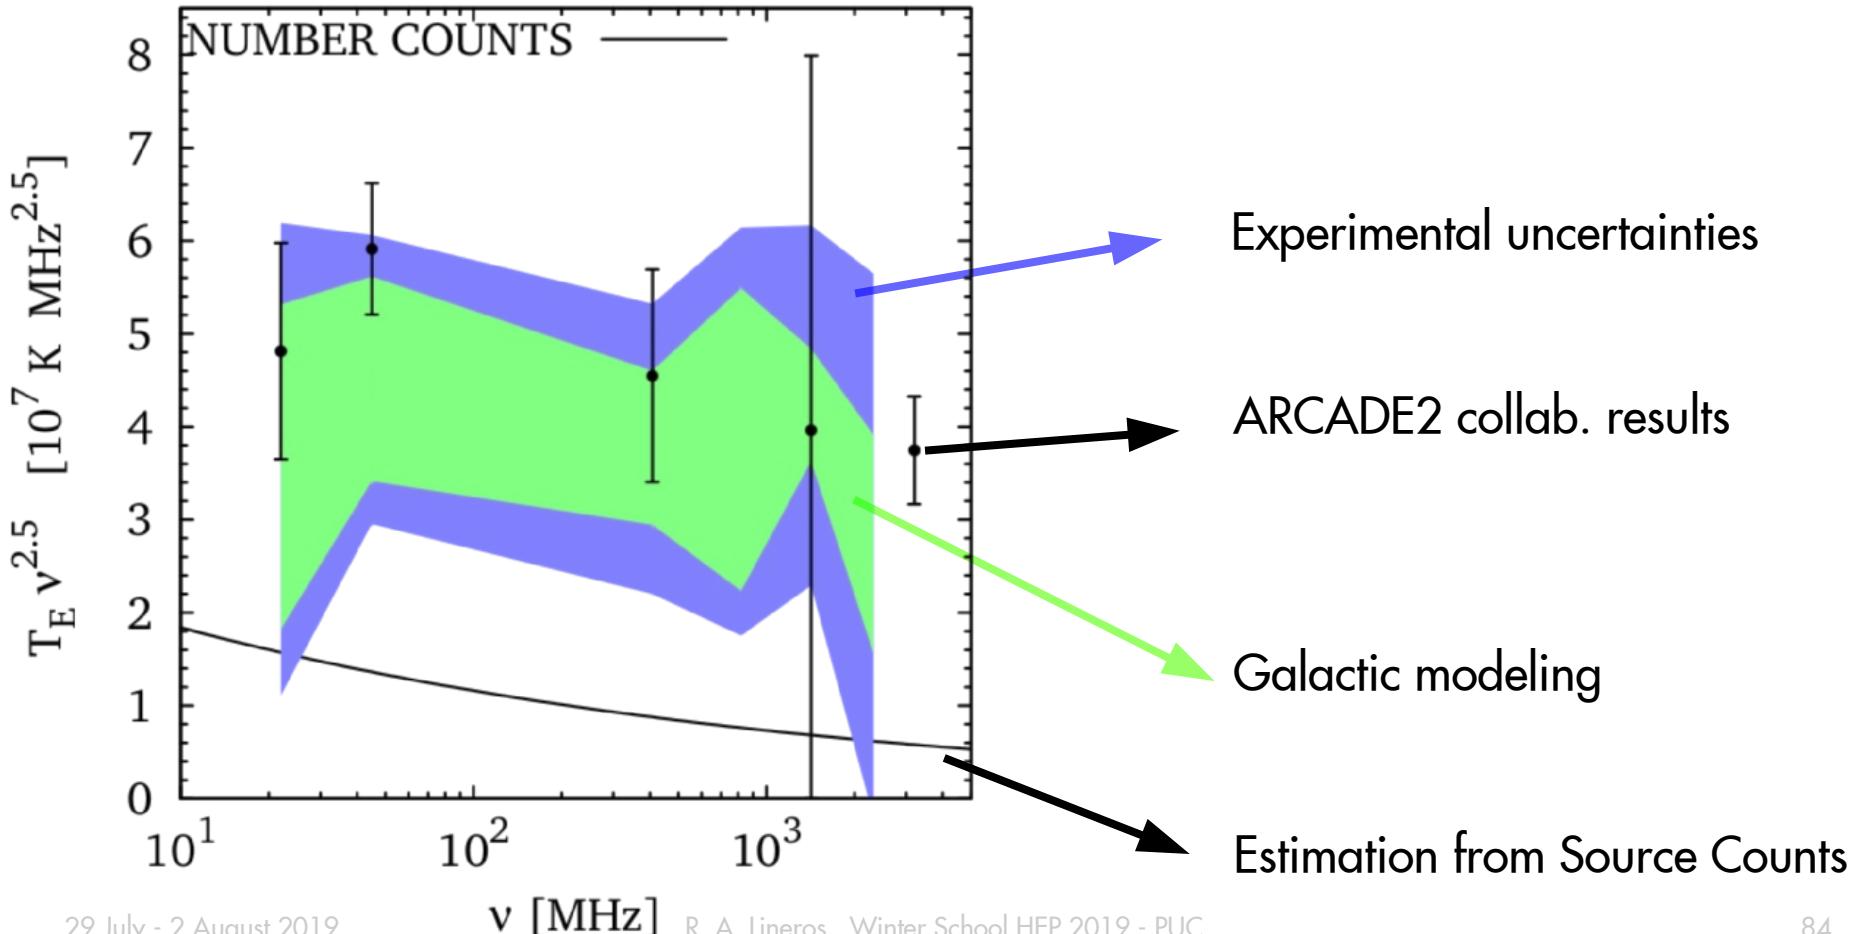

Fornengo et al.
arxiv:1112.4517

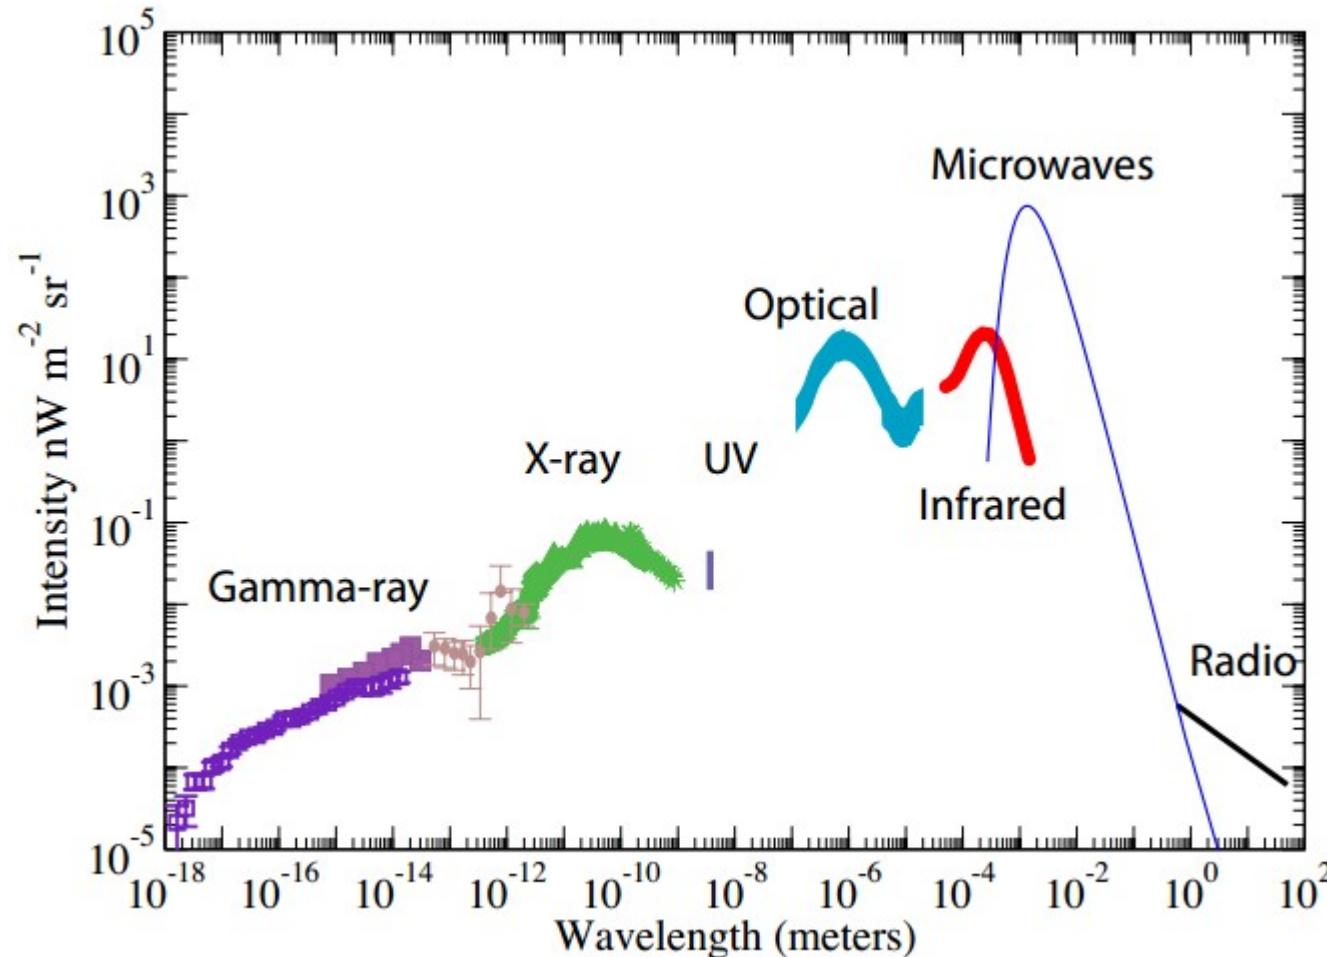

Constraints on the DM contribution can be obtained via

- Intensity
- Source count
- Angular power spectrum

Isotropic radio background

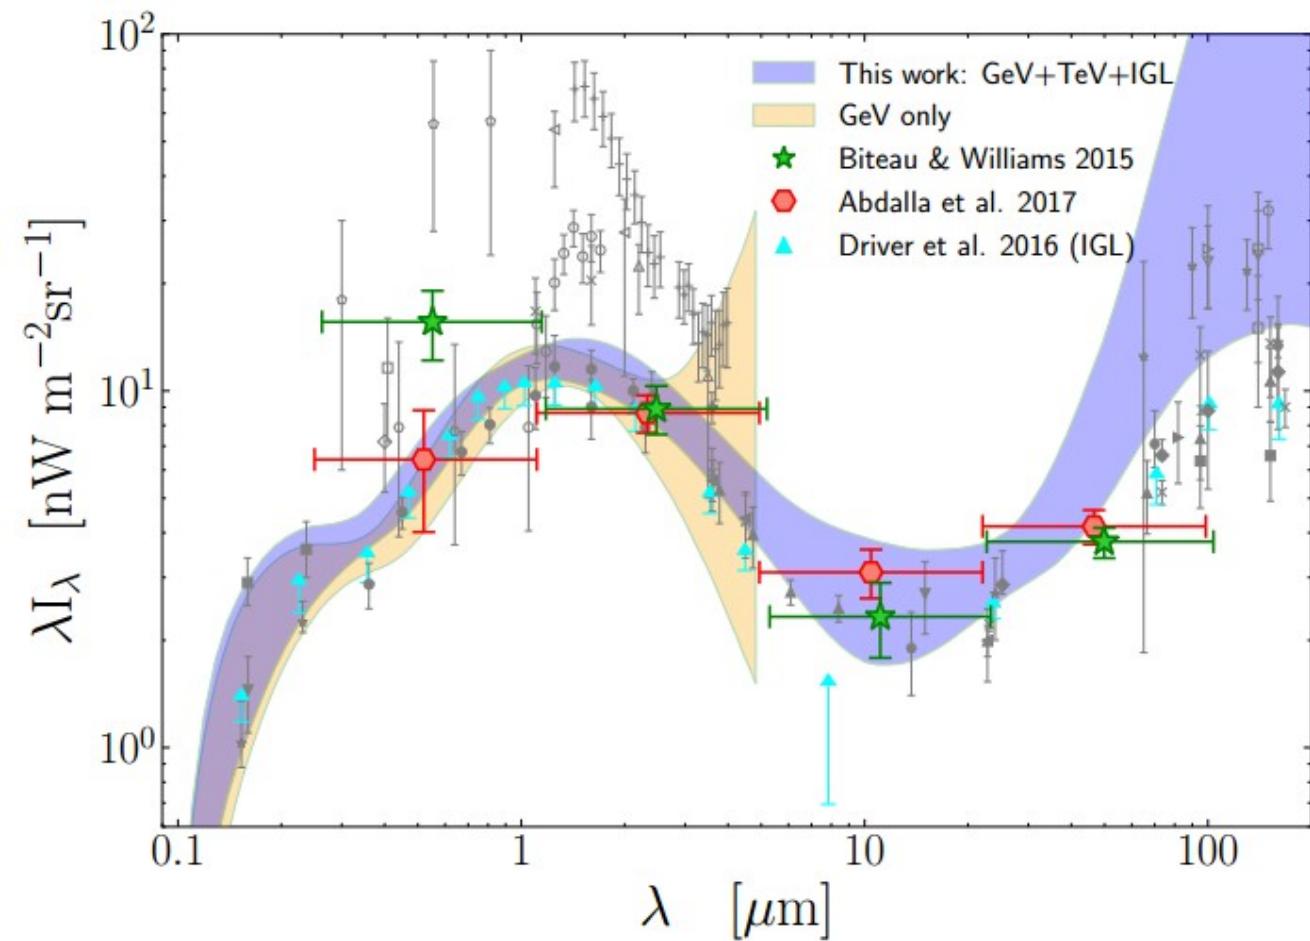

Extragalactic Background Light (EBL)

Cooray arXiv:1602.03512

- The whole EM spectrum carries information about the non thermal history of the Universe
- Important input to understand UHECR propagation

Extragalactic Background Light (EBL)

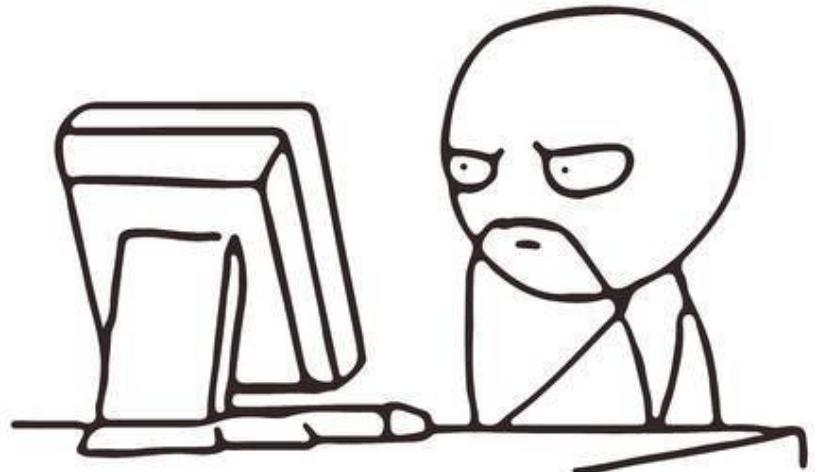

Desai et al. arXiv:1903.03126

- The intensity indicate the radiated power
- Optical depth of the Universe

Other phenomena

- Sunyaev–Zeldovich effect
- X-ray from keV Dark Matter
- Axion-Photon conversion
- Black holes
- Pulsar physics
- Gamma-ray bursts
- and many more

That's all

Gamma-rays

X-rays

Radiowaves

Microwaves
