Supplementary Figures.

Supplementary Figure 1. Current-voltage (I/V) curve of *X. laevis* oocytes expressing allelic variants of HvHKT1;5. **A, High Na⁺ allele HvHKT1;5N57S. **B**, High Na⁺ allele HvHKT1;5V416I. **C**, High Na⁺ allele HvHKT1;5S438N. **D**, Low Na⁺ allele HvHKT1;5I416V. **E**, Low Na⁺ allele Viivi (Na⁺_{HAP2}). Currents were recorded in 1 mM, 30 mM of Na⁺ or 30 mM K⁺ glutamate; data represented in mean ± SEM. n= 3-6.**

Supplementary Figure 2: Molecular models of HvHKT1;5_{HAP3_L189} and HvHKT1;5_{HAP3_P189} transporters in complex with Na⁺. **a., b.** Cartoon representations of HvHKT1;5_{HAP3_L189} (left, grey) and HvHKT1;5_{HAP3_P189} (right, deep teal) with cylindrical α -helices illustrate 3D folds. Constrictions in selectivity filters are bound by four residues (cpk magenta sticks, regular types) that contain Na⁺ (violet spheres). Black arrows illustrate directional flows of Na⁺ that are likely to enter the permeation trajectory by-passing selectivity filter constrictions. Variant residues N57, V416, S438 and L189 (cpk sticks and dots) in HvHKT1;5_{HAP3_L189}, and N57, V416 and S438 and P189 (cpk sticks and dots) in HvHKT1;5_{HAP3_P189} are indicated; the dots illustrate volumes of van der Waals radii. Four variations N57, V416 and S438 (regular types), and L189 or P189 (bold types) are shown in HvHKT1;5_{HAP3} proteins, from which P189 is deemed to be critical for protein structure that underlies function. **c., d.** Detailed views of α -helices, which neighbour constrictions of selectivity filters containing Na⁺ that are crucial for permeation function. Na⁺ (violet spheres) are located near the selectivity filter residues S76, G232, G351, G451 (cpk magenta sticks) in HvHKT1;5_{HAP3} structures. In each protein, polar contacts of L189 and P189 (shown in cpk sticks and dots), that are positioned on α -helix 4, are indicated by dashed lines at separations between 2.5 Å and 3.1 Å. Notably, leucine or proline residues in HvHKT1;5_{HAP3} structures effect packing angles of bordering α -helices 4 and 5. This packing angle between α -helices 4 and 5 in HvHKT1;5_{HAP3_P189} is more obtuse (two black arrows pointing to each other).

Supplementary Figure 2

Supplementary Figure 2 Methods.

The most suitable template for HvHKT1;5 transporter proteins was the *B. subtilis* KtrB K⁺ transporter (Protein Data Bank accession 4J7C, chain I) (Vieira-Pires *et al.*, 2013) as previously identified (Xu *et al.*, 2018). In KtrB, K⁺ was substituted by Na⁺ during modelling of all HKT1;5 proteins. 3D models of HvHKT1;5_{HAP3_L189} and HvHKT1;5_{HAP3_P189} in complex with Na⁺ were generated in Modeller 9v19 (Sali and Blundell, 1993) as described previously (Cotsafitis *et al.*, 2012, Waters *et al.*, 2013) incorporating Na⁺ ionic radii (Xu *et al.*, 2018) taken from the CHARMM force field (Brooks *et al.*, 2009), on the Linux station running the Ubuntu 12.04 operating system. Best scoring models (from an ensemble of 50) were selected based on the combination of Modeller Objective Function (Shen and Sali, 2006), Discrete Optimised Protein Energy term (Eswar *et al.*, 2008), PROCHECK (Laskowski *et al.*, 1993), ProSa 2003 (Sippl, 1993) and FoldX (Schymkowitz *et al.*, 2005). Structural images were generated in the PyMOL Molecular Graphics System V1.8.2.0 (Schrödinger LLC, Portland, OR, USA). Calculations of angles between selected α-helices in HvHKT1;5 models were executed in Chimera (Pettersen *et al.*, 2004) and evaluations of differences ($\Delta\Delta G = \Delta G_{mut} - \Delta G_{wt}$) in Gibbs free energies was performed with FoldX (Schymkowitz *et al.*, 2005). Sequence conservation patterns were analysed with ConSurf (Landau *et al.*, 2005; Celniker *et al.*, 2013) based on 3D models of HvHKT1;5 transporters.

Evaluations of stereo-chemical parameters indicated that the template and HvHKT1;5 models had satisfactory parameters as indicated by Ramachandran plots with two residues positioned in disallowed regions, corresponding to 0.5% of all residues, except of G and P. Average G-factors (measures of correctness of dihedral angles and main-chain covalent bonds) of the template, and the HvHKT1;5_{HAP3_L189} and HvHKT1;5_{HAP3_P189} models, calculated by PROCHECK (0.06, -0.07 and -0.21, respectively), and ProSa 2003 z-scores (measures of Cβ-Cβ pair interactions of -9.0, -5.6 and -6.5, respectively), indicated that template and modelled structures had favourable conformational energies.

Results and Discussion

1. Positional sequence identities between template and target sequences are in the twilight zone (20.6% and 20.4% between the template and HvHKT1;5_{HAP3_L189} and HvHKT1;5_{HAP3_P189} sequences, respectively), emphasising the difficulty of comparative modelling. This indicated that the attention must be paid to sequence alignments to be able to compare 3D models at the structural levels. Three types of alignments were generated, using Muscle (Edgar *et al.*, 2004), MUSTER (Wu and Zhang, 2007) and LOMETS (Wu and Zhang, 2008) algorithms. Input alignments for 3D modelling were generated by the combination of all alignments and secondary structure elements analyses using PsiPred (Buchan *et al.*, 2013), followed by manual adjustments to optimise positions of gaps in alignments.
2. 3D modelling revealed that overall 3D folds were similar, where selectivity filter constrictions carry one serine and three glycine residues, in accordance with their Na⁺ ion conductivity (Supplementary Figure 2).
3. Detailed analysis of environments around α-helix 4 and α-helix 5 (two black arrows pointing to each other in Supplementary Figure 2) revealed that L189 in α-helix 4 of HvHKT1;5_{HAP3_L189} established four polar contacts at separations between 2.7 Å to 3.1 Å with A185, V186, Y192 and S193 neighbouring residues.

4. These extensive polar contacts were not formed in the HvHKT1;5_{HAP3_P189} variant which only established two polar contacts at separations between 2.5 Å to 2.7 Å with S193. The lack of these cooperative binding networks in α-helix 4 around P189, and tight separations may impose severe structural rigidity on 3D folds HvHKT1;5_{HAP3_P189}. These α-helices might no longer properly function in the structural and functional context to ensure Na⁺ ion conductance.

5. In HvHKT1;5_{HAP3_L189}, the packing angle between α-helix 4 and α-helix 5 (two black arrows pointing to each other in Supplementary Figure 2) is 9° sharper compared to that in HvHKT1;5_{HAP3_P189} indicating that proline positions affect packing of α-helices in the specific 3D environments of HvHKT1;5 transporters. These changes in structural packing most likely contribute significantly to the structural rigidity and the lack of dynamics in 3D folds during transport.

6. Evaluations of differences of Gibbs free energies of HvHKT1;5_{HAP3} transporters revealed that the L189P mutation was energetically highly unfavourable (highly destabilising), and that the reverse mutation (P189 into L189) restored 100% of this energy loss, as expected.

7. In HvHKT1;5_{HAP3} transporters the differences in Gibbs free energies ($\Delta\Delta G$) between the P189L variant and the reverse mutation (L189P) were mildly destabilising and similar in both directions, suggesting that the environment of P189 has somewhat adapted to its 3D fold, thus a low level of conductance of Na⁺ could be observed in HvHKT1;5_{HAP3_P189}.

8. In HvHKT1;5_{HAP3} we identified a positive correlation between structural characteristics of α-helix 4/α-helix 5 (trends in angles based on α-helical planes), differences in Gibbs free energies of forward (P189L) and reverse (L189P) mutations, and the ability to conduct Na⁺. This correlation shows that in barley HvHKT1;5 transporters, conservation and variability of specific residues reflect profoundly on the transport function.

9. Sequence conservation patterns, based on 3D models of HvHKT1;5_{HAP3} using 368-370 sequences at sequence identities of 30% and higher (specifications: HMMER homolog search algorithm, UNIREF-90 Protein database with the E-value cutoff of 1·10⁻⁴, Bayesian Model of substitution for proteins), revealed that the P189 variation occurred only in barley.

10. There are four variations (N57, P189, V416 and S438) in HvHKT1;5_{HAP3} compared to HvHKT1;5_{HAP1} that represent 15 testable combinations. Not all of them could be tested for transport function. We suggest that three variations (N57, V416, S438) between HvHKT1;5_{HAP3} and HvHKT1;5_{HAP1} would have a lesser impact on Na⁺ conductivity. This is supported by conservation patterns analyses showing that these residues could be substituted by a variety of (mostly hydrophilic) residues, namely to R, S, A, P, G, L, H, D, Y, V, N, T, E, I (for N57), F, L, I, A, T, V (for V416), and N, T, Y, K, Q, S, R, H, A, P (for S438).

Supplementary Figure 5

Supplementary Figure 6: Geographical distribution of L189P in barley germplasm.

a. Geographical distribution of L189P in *HvHKT1;5* in *H. spontaneum*. Location of accessions containing L189 in blue and 189P in red. **b.** Geographical distribution of L189P in *HvHKT1;5* in *H. vulgare* landraces. Location of accessions containing L189 in blue ($\text{Na}^+_{\text{HAP1}}$, $\text{Na}^+_{\text{HAP2}}$) and 189P in red ($\text{Na}^+_{\text{HAP3}}$).

Supplementary Figure 6

A.

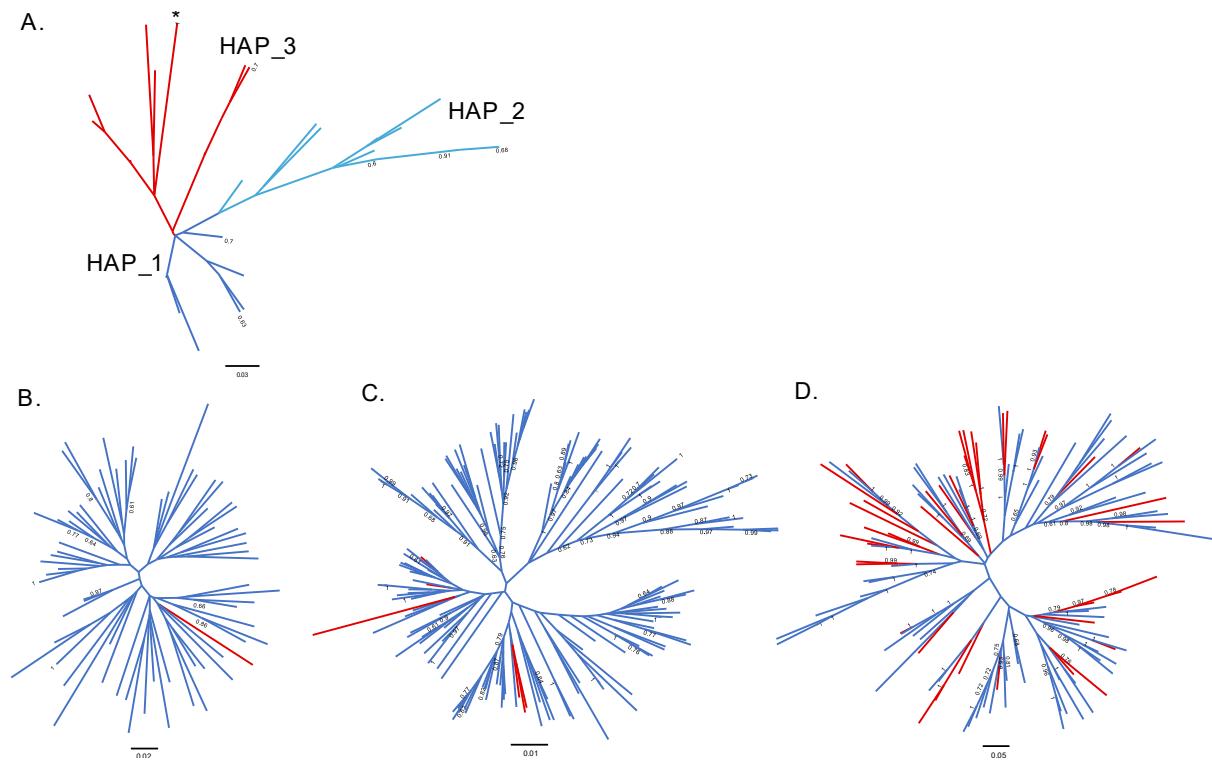

B.

Supplementary Figure 7. Distribution of *HvHKT1;5* haplotypes in different genepools. **A.**

Maximum likelihood tree of the coding sequence of *HvHKT1;5* in 73 *H. spontaneum*, including the 3 alleles of *HvHKT1;5*, $\text{Na}^+_{\text{HAP1}}$, $\text{Na}^+_{\text{HAP2}}$ and $\text{Na}^+_{\text{HAP3}}$, identified in our analysis of elite 2-row spring barleys for reference. Colours highlight separate clades, red corresponding to the clade containing the accession representing the high sodium allele from the elite cultivars ($\text{Na}^+_{\text{HAP3}}$), dark blue the low grain sodium allele ($\text{Na}^+_{\text{HAP1}}$), and light blue representing the other low grain sodium allele from the elite cultivars ($\text{Na}^+_{\text{HAP2}}$). Branches representing the three haplotypes are indicated with their haplotype number and * represents FT064 which shares the same haplotype as HAP_3.

B. Maximum likelihood tree using 4000 SNPs selected randomly from across the genome of *H. spontaneum* landraces, accessions containing L189 are in blue and 189P in red. **C.** Maximum likelihood tree using 4000 SNPs selected randomly from across the genome of *H. vulgare* landraces, accessions containing L189 are in blue and 189P in red. **D.** Maximum likelihood tree using 4000 SNPs selected randomly from across the genome of *H. vulgare* cultivars, accessions containing L189 are in blue and 189P in red. Bootstrap values are included.

Supplementary Table 2: Gene models in region identified on 4H as being significantly associated with grain Na⁺ content.

Gene Name	AGP Start	AGP End	Annotation
HORVU4Hr1G087780.1	638223190	638224749	Bifunctional inhibitor/lipid-transfer protein/seed storage 2S albumin superfamily protein
HORVU4Hr1G087790.2	638223460	638224442	undescribed protein
HORVU4Hr1G087800.1	638256143	638257008	Bifunctional inhibitor/lipid-transfer protein/seed storage 2S albumin superfamily protein
HORVU4Hr1G087810.1	638307473	638308181	undescribed protein
HORVU4Hr1G087820.1	638308517	638309341	undescribed protein
HORVU4Hr1G087830.1	638309936	638310439	unknown function
HORVU4Hr1G087840.3	638318732	638319925	Protein of unknown function (DUF1218)
HORVU4Hr1G087850.1	638333457	638333868	60S ribosomal protein L27-3
HORVU4Hr1G087860.1	638378121	638378871	Bifunctional inhibitor/lipid-transfer protein/seed storage 2S albumin superfamily protein
HORVU4Hr1G087870.1	638388268	638389146	Bifunctional inhibitor/lipid-transfer protein/seed storage 2S albumin superfamily protein
HORVU4Hr1G087880.1	638428432	638428842	60S ribosomal protein L27-3
HORVU4Hr1G087890.1	638478739	638479019	undescribed protein
HORVU4Hr1G087900.7	638479133	638484242	Flavin-containing monooxygenase family protein
HORVU4Hr1G087910.1	638486373	638488116	HXXXD-type acyl-transferase family protein
HORVU4Hr1G087920.1	638512331	638512750	Bifunctional inhibitor/lipid-transfer protein/seed storage 2S albumin superfamily protein
HORVU4Hr1G087930.1	638513260	638513517	undescribed protein
HORVU4Hr1G087940.1	638513647	638513841	unknown function
HORVU4Hr1G087950.1	638514999	638515151	Retrotransposon protein, putative, unclassified
HORVU4Hr1G087960.1	638634849	638636785	Sodium transporter HKT1
HORVU4Hr1G087970.1	638676269	638677708	TLD-domain containing nucleolar protein
HORVU4Hr1G087980.1	638774044	638774818	zinc finger protein 4
HORVU4Hr1G087990.6	639072081	639073349	Endoglucanase 15
HORVU4Hr1G088000.1	639080469	639080759	undescribed protein
HORVU4Hr1G088010.1	639196531	639196985	Protein TIME FOR COFFEE
HORVU4Hr1G088020.4	639208559	639213648	Protein NRT1/ PTR FAMILY 6.3

HORVU4Hr1G088030.1	639209570	639210052	undescribed protein
HORVU4Hr1G088040.1	639211354	639211737	undescribed protein
HORVU4Hr1G088050.1	639211900	639212080	undescribed protein
HORVU4Hr1G088060.4	639214025	639219029	Oxysterol-binding protein-related protein 2A
HORVU4Hr1G088070.1	639220179	639220679	undescribed protein
HORVU4Hr1G088080.4	639392933	639395123	expansin B2
HORVU4Hr1G088090.4	639495893	639498697	receptor kinase 2
HORVU4Hr1G088100.1	639682340	639682855	unknown function
HORVU4Hr1G088110.1	639706538	639707881	Eukaryotic aspartyl protease family protein
HORVU4Hr1G088120.1	639717292	639717831	Retrotransposon protein
HORVU4Hr1G088130.3	639721611	639722958	UvrB/uvrC motif-containing protein isoform 5
HORVU4Hr1G088140.2	639752757	639755359	expansin B2
HORVU4Hr1G088150.1	639767541	639768193	undescribed protein
HORVU4Hr1G088160.1	639772779	639774122	Eukaryotic aspartyl protease family protein
HORVU4Hr1G088170.1	639865436	639868763	Transposon protein, putative, CACTA, En/Spm sub-class
HORVU4Hr1G088180.1	639883596	639884246	undescribed protein
HORVU4Hr1G088190.9	639939694	639946933	2-phosphoglycerate kinase
HORVU4Hr1G088200.1	639942466	639943237	Endonuclease-reverse transcriptase HmRTE-e01
HORVU4Hr1G088220.1	639950849	639951108	undescribed protein
HORVU4Hr1G088210.35	639956048	639966348	CCR4-NOT transcription complex subunit 1
HORVU4Hr1G088230.1	640109804	640110976	Transposon protein, putative, CACTA, En/Spm sub-class
HORVU4Hr1G088240.1	640111176	640112560	unknown function
HORVU4Hr1G088250.15	640120326	640127451	undescribed protein
HORVU4Hr1G088260.1	640127727	640127928	undescribed protein
HORVU4Hr1G088270.14	640198187	640208474	ATP-dependent RNA helicase, putative
HORVU4Hr1G088280.2	640310745	640313017	GATA transcription factor 2
HORVU4Hr1G088290.1	640317992	640319088	undescribed protein
HORVU4Hr1G088300.1	640320298	640321148	undescribed protein

HORVU4Hr1G088310.1	640327918	640328758	undescribed protein
HORVU4Hr1G088320.1	640333038	640333841	Double Clp-N motif-containing P-loop nucleoside triphosphate hydrolases superfamily protein
HORVU4Hr1G088330.1	640393516	640393749	undescribed protein
HORVU4Hr1G088340.10	640421579	640432476	2-oxoglutarate (2OG) and Fe(II)-dependent oxygenase superfamily protein
HORVU4Hr1G088350.10	640434928	640441561	Agenet domain containing protein, expressed
HORVU4Hr1G088360.1	640445110	640445369	undescribed protein
HORVU4Hr1G088370.4	640445428	640449337	undescribed protein
HORVU4Hr1G088380.3	640445565	640449635	undescribed protein
HORVU4Hr1G088390.1	640491514	640497006	Coatomer, alpha subunit
HORVU4Hr1G088400.5	640497538	640499359	undescribed protein
HORVU4Hr1G088410.2	640498962	640499870	unknown function
HORVU4Hr1G088420.1	640500341	640500764	undescribed protein
HORVU4Hr1G088440.10	640503829	640510906	Methionyl-tRNA formyltransferase
HORVU4Hr1G088430.17	640504902	640510925	Plant protein of unknown function (DUF828) with plant pleckstrin homology-like region
HORVU4Hr1G088450.7	640515684	640518342	Plant protein of unknown function (DUF828) with plant pleckstrin homology-like region
HORVU4Hr1G088460.1	640520324	640520646	Serine/threonine-protein phosphatase 7 long form-like protein
HORVU4Hr1G088470.27	640535795	640538638	phosphatidylserine decarboxylase 1
HORVU4Hr1G088480.28	640540544	640546585	Chromosome 3B, genomic scaffold, cultivar Chinese Spring
HORVU4Hr1G088490.1	640547189	640550955	Cell number regulator 6
HORVU4Hr1G088500.2	640555331	640556013	undescribed protein
HORVU4Hr1G088510.1	640560265	640561373	undescribed protein
HORVU4Hr1G088520.1	640580304	640581107	Core-2/I-branching beta-1,6-N-acetylglucosaminyltransferase family protein
HORVU4Hr1G088530.1	640584186	640586647	Eukaryotic aspartyl protease family protein
HORVU4Hr1G088540.8	640595868	640611352	Chromodomain-helicase-DNA-binding protein 1-like
HORVU4Hr1G088550.1	640605004	640605309	undescribed protein
HORVU4Hr1G088570.2	640630455	640638112	Leucine-rich repeat receptor-like protein kinase family protein
HORVU4Hr1G088560.2	640630460	640640807	unknown function
HORVU4Hr1G088580.5	640641588	640647209	Leucine-rich repeat receptor-like protein kinase family protein

HORVU4Hr1G088590.6	640647353	640649638	unknown function
HORVU4Hr1G088600.4	640650819	640654398	Leucine-rich repeat receptor-like protein kinase family protein
HORVU4Hr1G088610.1	640662818	640665994	Quinone oxidoreductase
HORVU4Hr1G088620.1	640666350	640668581	Phosphoglycerate mutase family protein
HORVU4Hr1G088630.2	640671280	640671753	unknown function
HORVU4Hr1G088640.1	640673927	640674503	Retrotransposon protein, putative, unclassified
HORVU4Hr1G088650.6	640685421	640696260	protein kinase family protein
HORVU4Hr1G088660.1	640701625	640703561	E3 ubiquitin-protein ligase PRT6
HORVU4Hr1G088670.3	640706584	640707045	unknown function
HORVU4Hr1G088680.1	640707872	640709468	unknown function
HORVU4Hr1G088690.1	640711150	640712652	General transcription factor IIH subunit 5
HORVU4Hr1G088700.2	640716984	640726190	ARABIDILLO-1
HORVU4Hr1G088710.1	640725147	640726035	undescribed protein
HORVU4Hr1G088720.10	640726975	640730280	Palmitoyl-protein thioesterase 1
HORVU4Hr1G088730.1	640731610	640733054	undescribed protein
HORVU4Hr1G088740.1	640731612	640733092	Class I glutamine amidotransferase-like superfamily protein
HORVU4Hr1G088750.1	640899336	640899443	undescribed protein
HORVU4Hr1G088760.17	641042283	641047868	Long chain base biosynthesis protein 2d
HORVU4Hr1G088770.5	641043282	641046740	undescribed protein
HORVU4Hr1G088780.1	641086962	641088357	early nodulin-like protein 8
HORVU4Hr1G088790.5	641091033	641094510	arginine-serine-rich splicing factor 35
HORVU4Hr1G088800.1	641133970	641134732	undescribed protein
HORVU4Hr1G088810.1	641141491	641142102	Retrotransposon protein, putative, unclassified
HORVU4Hr1G088820.1	641145850	641152993	undescribed protein
HORVU4Hr1G088830.2	641145875	641152894	undescribed protein
HORVU4Hr1G088840.2	641153746	641156383	Post-GPI attachment to proteins factor 3
HORVU4Hr1G088850.4	641157517	641161403	Protein CHAPERONE-LIKE PROTEIN OF POR1, chloroplastic
HORVU4Hr1G088860.1	641185538	641189869	Major facilitator superfamily protein

HORVU4Hr1G088870.1	641191823	641192977	Mitochondrial import inner membrane translocase subunit TIM23-1
HORVU4Hr1G088880.7	641237832	641244215	kinesin 4
HORVU4Hr1G088890.2	641253106	641254865	Protein NRT1/ PTR FAMILY 8.1
HORVU4Hr1G088900.3	641255865	641265633	Alanine--tRNA ligase
HORVU4Hr1G088910.12	641271573	641284731	Protein kinase superfamily protein
HORVU4Hr1G088920.1	641290897	641291740	unknown function
HORVU4Hr1G088930.2	641293496	641295060	P-loop containing nucleoside triphosphate hydrolases superfamily protein
HORVU4Hr1G088940.1	641382061	641382844	undescribed protein
HORVU4Hr1G088950.1	641383076	641384750	undescribed protein
HORVU4Hr1G088960.2	641404116	641405408	undescribed protein
HORVU4Hr1G088970.1	641404825	641406494	undescribed protein
HORVU4Hr1G088980.1	641405536	641408090	undescribed protein
HORVU4Hr1G088990.1	641408194	641411623	undescribed protein
HORVU4Hr1G089000.1	641423398	641423880	Transposon protein, putative, Pong sub-class
HORVU4Hr1G089010.1	641429665	641431292	undescribed protein
HORVU4Hr1G089020.1	641454180	641454425	Retrotransposon protein, putative, unclassified, expressed
HORVU4Hr1G089030.1	641464335	641465907	Protein of unknown function, DUF584
HORVU4Hr1G089040.1	641468548	641468670	undescribed protein
HORVU4Hr1G089050.1	641468869	641469015	unknown function
HORVU4Hr1G089060.3	641590688	641595759	L-gulonolactone oxidase 5
HORVU4Hr1G089070.1	641592081	641592694	undescribed protein
HORVU4Hr1G089080.3	641600093	641606961	UDP-N-acetylglucosamine--peptide N-acetylglucosaminyltransferase 110 kDa subunit
HORVU4Hr1G089090.2	641608354	641613003	Chaperone protein DnaK
HORVU4Hr1G089100.1	641617531	641618461	unknown function
HORVU4Hr1G089110.1	641759666	641760070	undescribed protein
HORVU4Hr1G089120.1	641771191	641775630	Trihelix transcription factor GT-2
HORVU4Hr1G089130.1	641786871	641790804	TTF-type zinc finger protein with HAT dimerisation domain
HORVU4Hr1G089140.1	641790981	641791310	hAT dimerisation domain-containing protein / transposase-related

HORVU4Hr1G089150.1	641794439	641795275	undescribed protein
HORVU4Hr1G089160.1	641798627	641801315	unknown function
HORVU4Hr1G089170.1	641806339	641807327	undescribed protein
HORVU4Hr1G089180.1	641837276	641838618	Retrotransposon protein, putative, unclassified
HORVU4Hr1G089190.1	641839374	641840867	undescribed protein
HORVU4Hr1G089200.2	641851862	641853556	Protein kinase superfamily protein
HORVU4Hr1G089210.1	641904210	641906080	Plant protein of unknown function (DUF247)
HORVU4Hr1G089220.2	641910099	641911620	Protein LURP-one-related 8
HORVU4Hr1G089230.1	641924251	641926641	Cytochrome P450 superfamily protein
HORVU4Hr1G089240.1	642024767	642025697	unknown function
HORVU4Hr1G089250.1	642027381	642027828	Retrotransposon protein, putative, unclassified
HORVU4Hr1G089260.1	642028955	642029657	undescribed protein
HORVU4Hr1G089270.1	642064582	642066848	Zinc finger CCCH domain-containing protein 20
HORVU4Hr1G089280.5	642067124	642071227	Transmembrane and coiled-coil domain-containing protein 4
HORVU4Hr1G089300.1	642149539	642149808	undescribed protein
HORVU4Hr1G089310.19	642155943	642276817	AP-2 complex subunit alpha-1
HORVU4Hr1G089310.19	642155943	642276817	AP-2 complex subunit alpha-1
HORVU4Hr1G089320.1	642174952	642176162	Zinc finger CCCH domain-containing protein 44
HORVU4Hr1G089330.2	642199303	642201938	2-oxoglutarate (2OG) and Fe(II)-dependent oxygenase superfamily protein
HORVU4Hr1G089340.1	642200689	642201204	undescribed protein
HORVU4Hr1G089350.4	642210402	642217528	WD repeat-containing protein 6
HORVU4Hr1G089360.1	642223610	642225409	Flavin-containing monooxygenase family protein
HORVU4Hr1G089370.1	642233366	642234607	General transcription factor 2-related zinc finger protein
HORVU4Hr1G089380.1	642236484	642236702	unknown function
HORVU4Hr1G089390.1	642244367	642244741	unknown function
HORVU4Hr1G089400.3	642249025	642249328	L-tyrosine decarboxylase
HORVU4Hr1G089410.1	642261253	642262994	2-oxoglutarate (2OG) and Fe(II)-dependent oxygenase superfamily protein
HORVU4Hr1G089290.7	642309174	642316391	Zinc finger CCCH domain-containing protein 19

HORVU4Hr1G089420.1	642383189	642383376	unknown function
HORVU4Hr1G089430.1	642393080	642393434	undescribed protein
HORVU4Hr1G089440.1	642462273	642462618	Retrotransposon protein, putative, unclassified
HORVU4Hr1G089450.1	642496560	642498144	NAC domain protein,
HORVU4Hr1G089460.1	642513360	642523797	receptor-like protein kinase 1
HORVU4Hr1G089470.2	642527742	642530387	dihydroflavonol 4-reductase
HORVU4Hr1G089480.1	642535429	642537069	2-oxoglutarate (2OG) and Fe(II)-dependent oxygenase superfamily protein
HORVU4Hr1G089490.2	642543999	642544800	Non-specific lipid-transfer protein 2G
HORVU4Hr1G089500.1	642559204	642559830	Non-specific lipid-transfer protein 2G
HORVU4Hr1G089510.3	642560707	642564722	beta-amylase 5
HORVU4Hr1G089520.1	642568886	642570443	Heavy metal-associated domain, putative
HORVU4Hr1G089530.1	642569427	642569815	undescribed protein

Analysis of phenotypic traits

There is confounding between Allele (2 levels), Haplotype (3 levels) and Line (8 levels) as one particular line can only have a single allele and haplotype-so essentially there are only 8 combinations of allele, haplotype and line. When fitting a model it is therefore not possible to fit a crossed interaction between these 3 factors as many of the combinations do not exist within the data set. The treatment structure for these 3 factors needs to be nested: Allele/Haplotypes/Lines. So lines are within haplotypes, which are within alleles.

The linear model approach presented aims to isolate whether the differences in trait are attributable to the alleles, haplotypes within alleles or lines within haplotypes within alleles or their interactions.

Salt treatment is also of interest, therefore a nested treatment structure between factors Allele, Haplotypes and Lines crossed with the salt Treatment can be used. The terms in the model are as follows:

Terms in the model

Term	Interpretation	df
(Intercept)	Overall mean	1
Allele	Allele	1
Treatment	Treatment	2
Allele:Haplotype	Haplotype	1
Allele:Treatment	Allele:Treatment	2
Allele:Haplotype:Line	Line	5
Allele:Haplotype:Treatment	Haplotype:Treatment	2
Allele:Haplotype:Line:Treatment	Line:Treatment	10

For the shoot Na, only three lines were included in the experiment, therefore Haplotype and Line are completely confounded and only one can be included in the model. The terms in the model are as follows:

Terms in the model

Term	Interpretation	df
(Intercept)	Overall Mean	1
Allele	Allele	1
Treatment	Treatment	2
Allele:Haplotype	Haplotype	1
Allele:Treatment	Allele:Treatment	2
Allele:Haplotype:Treatment	Haplotype:Treatment	2

Significance was tested at the 5% level. In general, terms in a model should be tested in a hierarchical manner, however, because of the confounding in this model there are exceptions to this. For example, the three-way interaction Allele:Haplotype:Treatment and the two way interaction Allele:Treatment can be examined simultaneously with the 4-way interaction. In addition, because of confounding there is an alternative interpretation of some terms. For example, the three-way interaction between Allele, Haplotype and Line can be interpreted as a line effect and the two way interaction between Allele and Haplotype corresponds to haplotype effects. Because of the difficult in interpretation of relevant significant terms, in the Anova tables below, terms highlighted are the appropriate significant terms for interpretation.

ASReml-R was which uses a REML approach was used for analysis because of the unbalanced nature of the data. Anova tables presented are from ASReml. For some lower order terms predicted values were not available from ASReml due to missing treatment combinations. For these terms predicted values were obtained using a linear regression model in Genstat. For consistency, if lower order terms were significant, all predicted values available are from a linear regression model conducted in Genstat. Differences between treatment levels was determined by Tukeys if the standard error of difference variance covariance matrix was available or by a Bonferonni corrected LSD (least significant difference) if just the average standard error of difference was available.

Biomass

There is a significant three-way interaction between Allele, Haplotype and Line and therefore the trait differs between lines. There is a significant interaction between Allele and Haplotype (borderline) and there is also a main effect of Treatment and of Allele. The treatment effect is independent of allele, haplotype and line. All predicted values are from Genstat regression.

Anova Table: Biomass

*predicted mean values on transformed scale compared with bonferroni corrected LSD

Grain K

There is a significant treatment effect. Allele, Haplotype and Line are not significant.

Anova Table: Grain K

Term	Df	Sum of Sq	Wald statistic	Pr(Chisq)
Allele	1	2.639048e+06	2.4878311	0.1147297
Treatment	2	8.649643e+06	8.1540218	0.0169581
Allele:Haplotype	1	5.751935e+05	0.5422351	0.4615079
Allele:Treatment	2	5.369355e+03	0.0050617	0.9974724
Allele:Haplotype:Line	5	7.656622e+06	7.2179002	0.2049326
Allele:Haplotype:Treatment	2	1.365310e+06	1.2870778	0.5254297
Allele:Haplotype:Line:Treatment	10	7.635811e+06	7.1982817	0.7066027

Predicted Values treatment: Grain K

Treatment	Predicted value	Std error	Group*
Control	7751	192.7	a
150 mM NaCl	7329	213.7	ab
250 mM NaCl	7077	243.0	b

* predicted mean values of salt treatment compared to control with LSD.

Shoot Na

A square root transformations for Grain Na was necessary in order to meet model assumptions. There is a significant two-way interaction between Allele and Treatment. Therefore, the response differs depending on both the allele and treatment.

Anova Table: Shoot Na

Term	Df	Sum of Sq	Wald	
			statistic	Pr(Chisq)
Allele	1	7056.94885	63.6587791	0.0000000
Treatment	2	44749.94004	403.6768024	0.0000000
Allele:Haplotype	1	280.59661	2.5311842	0.1116164
Allele:Treatment	2	2462.70965	22.2154209	0.0000150
Allele:Haplotype:Treatment	2	65.64216	0.5921397	0.7437355
