Abstract

In this research, we will utilise geological deposits left behind by mountain glaciers in New Zealand and South America to reconstruct the magnitude and timing of climate change during the Antarctic Cold Reversal. We will then use our new glacier reconstructions with all available quantitative climate proxy archives to evaluate a suite of climate model experiments that are specifically designed to identify whether the Antarctic Cold Reversal was driven largely from the North Atlantic, or the Southern Ocean. Our findings will help to anticipate possible abrupt climate changes that could result from future ice sheet collapse.
