Keywords: silicon isotopes, hyporheic zone, permafrost, weathering, Antarctica

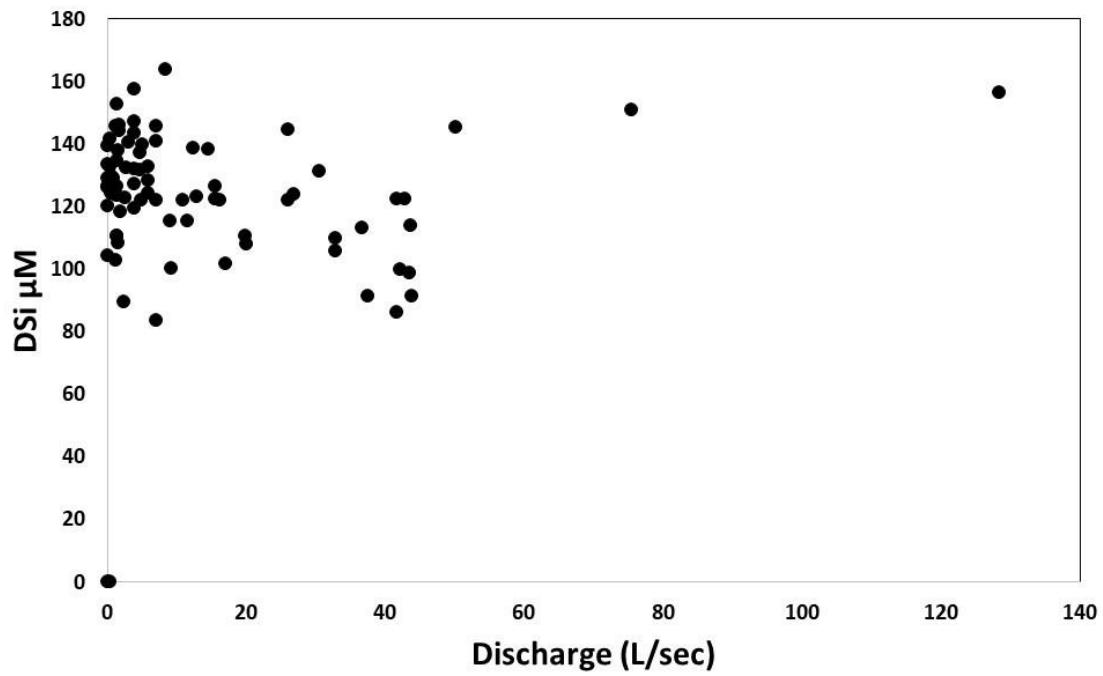

Supplementary information

S.I. Fig. 1 Three isotope plot for samples measured in this study (Table 1). Plot shows $\delta^{29}\text{Si}$ versus $\delta^{30}\text{Si}$ of samples, within error of the mass dependent fractionation array with a slope of 0.5178. This supports the interference-free determination of all three Si isotopes via MC-ICP-MS (Young et al., 2002).

S.I. Fig. 2 a-c Discharge, conductivity and water temperature data for 2014 – 2015, 2015 – 2016, 2016 – 2017 seasons determined at gauge F8 in Crescent Stream. Data source: LTER McMurdo Dry Valleys database, Gooseff and McKnight, (2019). The dashed lines correspond to the sampling days in Table 1.

S.I. Fig. 3 The relationship between long-term (1994 – 2014) discharge and dissolved silicon (DSi) concentrations (filtered at $< 0.4 \mu\text{m}$). Data source: LTER McMurdo Dry Valleys database, Si concentrations: Lyons and Welch, (2015); discharge data: Gooseff and McKnight, (2019).

S.I. Table 1. Diatom species and their relative abundance in orange and black microbial mats in Crescent Stream in January 2014 and January 2016. The *species richness*, the number of different species represented in an ecological community, is also shown. The samples for diatom analysis were prepared and analyzed as described by Stanish et al. 2012. np = not present.

Genus		Species	Taxon ID	Microbial mat samples from Crescent Stream
