

Supplementary material

Supplementary Table 1. The deaths of 32 cetaceans were due to fishery interactions in the Canary Islands (from January 2000 to December 2018). The table shows the species; diving behavior (D, deep diver or S, shallow diver); stranding date (day.month.year); stranding event (D, dead or A, alive); island (FV, Fuerteventura; GC, Gran Canaria; LNZ, Lanzarote; LP, La Palma; TNF, Tenerife); sex (F, female or M, male); growth development category (calf, juvenile, subadult, adult); gonad maturation (I, immature; M, mature; P, pregnant); body condition (very poor, poor, fair, good); decomposition code (1, very fresh; 2, fresh; 3, moderate autolysis; 4, advanced autolysis; 5, very advanced autolysis); and type of fishing interaction [chronic entanglement; fisherman aggression, and bycatch (longline hook ingestion, aggression during handling (aggression), peracute underwater entrapment (PUE), and dolphins released alive that became stranded and died, owing to PUE lesions (released)].
