**Figure S1.** Difference between inlet and outlet temperature of the 1%Pd/5%V<sub>2</sub>O<sub>5</sub>/20%TiO<sub>2</sub>-Al<sub>2</sub>O<sub>3</sub> monolith during the light-off experiments with gas mixtures A-E (Table 1).

**Figure S2.** H<sub>2</sub> conversion (red) of a light-off of the 1%Pd/5%V<sub>2</sub>O<sub>5</sub>/20%TiO<sub>2</sub>-Al<sub>2</sub>O<sub>3</sub> monolith catalyst with a NO-free gas mixture (1% H<sub>2</sub>, 10% O<sub>2</sub> in N<sub>2</sub>). Reactor temperatures are shown for the thermocouples located upstream of the catalyst at the gas inlet (black) and downstream at the outlet (blue).

**Figure S3.** NO conversion and product selectivities during a long-term measurement over 12 h of the 1%Pd/5% $V_2O_5$ /20% $TiO_2$ - $Al_2O_3$  monolith catalyst at 220 °C inlet temperature with the gas mixtures A (a, 1000 ppm NO, 5000 ppm  $H_2$  and 10%  $O_2$  in  $N_2$ ) and E (b, 1000 ppm NO, 5000 ppm  $H_2$ , 10%  $O_2$  and 5%  $H_2O$  in  $N_2$ ), GHSV = 60 000  $h^{-1}$ .

**Figure S4.** Thermodynamic equilibrium of the product distribution in a feed exhaust gas of 1000 ppm NO, 10% O<sub>2</sub> in N<sub>2</sub> calculated with the DETCHEM™ software package.
