

Supplementary Figure S6 | Redundancy analysis (RDA) with environmental drivers of community structure highlighting drivers of the river-fjord transition in fjord water column and river stations. Constraining variables are indicated in red. Only OTUs with an RDA score > 0.08 are represented, and are scaled by 3. The names of the closest related genus or family (highest specified taxonomic resolution) is given for these OTUs. Percentages indicate the amount of variance explained by each axis.
