Fatiando a Terra

open-source tools for geophysics

This talk will be mostly about the Fatiando a Terra project. **Fun fact:** the name is Portuguese for "Slicing the Earth"

First, a bit of history

2010

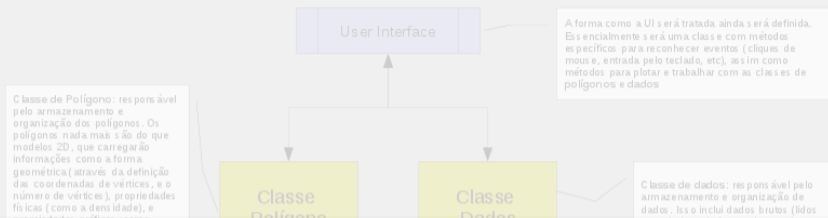

2014

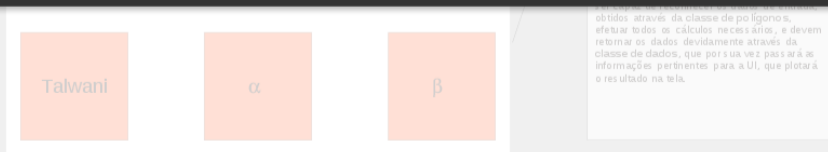

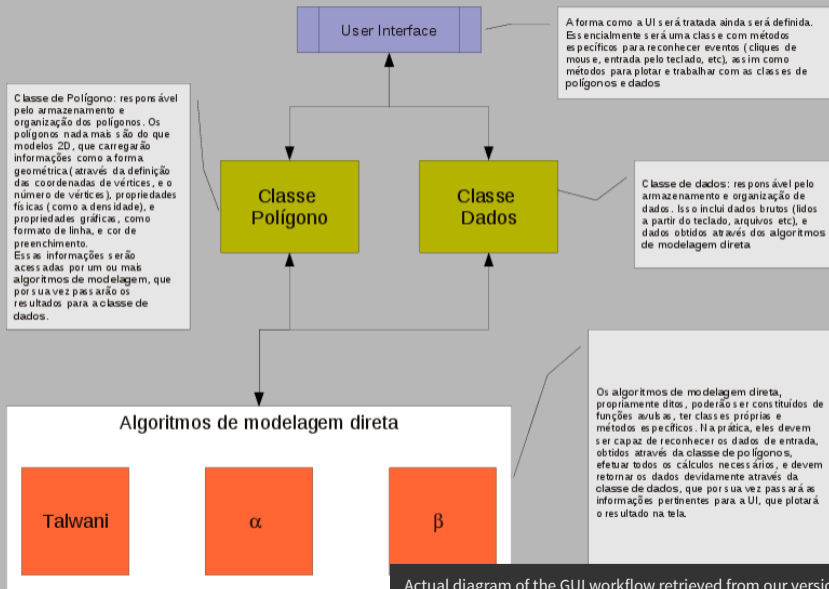

2016

Our journey starts in Southeastern Brazil, specifically in São Paulo and Rio de Janeiro

Started around 2008 as a GUI for 2D gravity modelling
developed with fellow undergrads at USP, Brazil

Actual diagram of the GUI workflow retrieved from our version control system.

Learned a lot about software development: version control (went through 3), tests, packaging, documentation, and more.

✓ 133 SConstruct

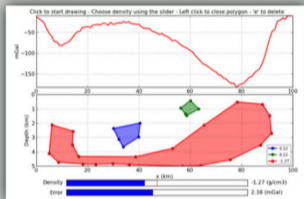

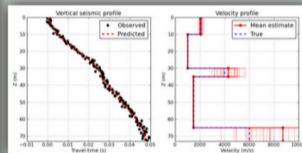

Example Gallery

Some of the functionality already implemented:

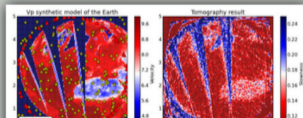

Moulder - 2D gravimetric direct modeling

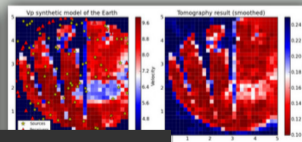

Inversion of synthetic vertical seismic profile data

Straight-ray travel-time tomography of large models using sparse linear algebra

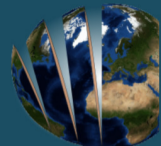

Straight-ray travel-time tomography

Around 2011 we built the first website and gallery. We ended up building a 2D GUI and much more, from seismic to potential fields and heat flow.

Fatiando a Terra: Geophysical modeling and inversion

An open source toolkit for geophysical modeling and inversion

Fatiando provides an easy and flexible way to perform common tasks like: generating synthetic data, forward modeling, inversion, 3D visualization, and more! All from inside the powerful [Python](#) language.

For more information visit [the official site](#).

The **source code** of Fatiando is hosted on [GitHub](#).

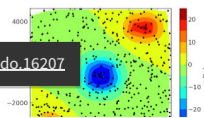

License: Fatiando is licensed under the **BSD license**. This means that it can be reused and remixed with few restrictions. See the [license text](#) for more information.

The best **place to start** learning about Fatiando is the [Cookbook](#)! There, you'll find many sample scripts with common tasks that can help you get started.

As an **example**, this is how easy it is to create synthetic noise-corrupted gravity data on random points from a 3D prism model:

```
>>> from fatiando.mesher import Prism
>>> from fatiando.vis import mpl
>>> from fatiando import gridder, utils, gravmag
>>> # Create the prism model
>>> prisms = [
...     Prism(-4000, -3000, -4000, -3000, 0, 2000, {'density':1000}),
...     Prism(-1000, 1000, -1000, 1000, 0, 2000, {'density':-1000}),
...     Prism(2000, 4000, 3000, 4000, 0, 2000, {'density':1000})]
>>> # Generate 500 random observation points at 100m height
>>> xp, yp, zp = gridder.scatter((-5000, 5000, -5000, 5000), 500, z=-100)
>>> # Calculate their gravitational effect and contaminate it with 0.1 mGal
>>> # gaussian noise
>>> gz = utils.contaminate(gravmag.prism.gz(xp, yp, zp, prisms), 0.1)
>>> # Plot the result
>>> mpl.contourf(xp, yp, gz, (100, 100), 12, interp=True)
>>> cb = mpl.colorbar()
>>> cb.set label('mGal')
>>> mpl.plot(xp, yp, '.k')
>>> mpl.show()
```

which results in something like this:

First documentation built using [sphinx](#) for v0.1 (2013). doi:[10.5281/zenodo.16207](https://doi.org/10.5281/zenodo.16207)

fatiando a terra

An open-source Python library for modeling and inversion in geophysics.

Our goal is provide a comprehensive and extensible framework for geophysical data analysis and the development of new methodologies.

Research

Make your research more **reproducible** by writing a Python script or [Jupyter notebook](#) instead of clicking through complicated menus.

Development

Don't start from scratch! Build upon the existing tools in Fatiando to develop new methods.

Teaching

Combine Fatiando with the [Jupyter notebook](#) to make rich, interactive documents. Great for teaching fundamental concepts of geophysics!

Overview

Santiago and other contributors joined and we made several releases until **v0.5** (2016). doi:[10.5281/zenodo.157746](https://doi.org/10.5281/zenodo.157746)

Modeling, inversion, and processing for potential field methods.

3D forward modeling with prisms, polygonal prisms, spheres, and toroids.

Simple modeling functions for seismics and seismology.

Two problems for Cartesian straight ray tomography: VEP, epicenter

The good parts

 State-of-the-art algorithms

 Used in several thesis & papers (>70 citations)

 2-3 active contributors

 Enabled teaching through simulation

The good parts

-  State-of-the-art algorithms
-  Used in several thesis & papers (>70 citations)
-  2-3 active contributors
-  Enabled teaching through simulation

The bad parts

-  Too many toy problems and experimental code
-  Not designed for testability
-  Difficult to maintain
-  Unstable foundations for growth
