WHAT IS NEEDED?

AGU requires that the underlying data needed to understand, evaluate, and build upon the reported research be available at the time of peer review and publication. Additionally, authors should make available software that has a significant impact on the research. This entails:

- 1. Depositing the data and software in a trusted repository, as appropriate, and preferably with a DOI
- Including an Availability Statement as a separate paragraph in the Open Research section explaining to the reader where and how to access the data and software
- 3. And including citation(s) to the deposited data and software, in the Reference Section.

Click on the headings below for detailed information on:

- Models & Simulations
- Journal-Specific Data Guidance
- · International Geo Sample Numbers

WHAT DATA NEEDS TO BE AVAILABLE?

Primary and processed data used for your research should be preserved and made available.

Generally, the underlying data are considered to be the types of data usually preserved in domain repositories for each discipline. These may include raw data, but are usually the processed or refined data that support and lead to the described results and allow other readers to assess your conclusions and build off your work.

In your paper, cite these data, as well as any data you used from other sources, and include information about access to the data in the availability statement. For model or simulation data, follow journal specific guidance on prioritizing preserved output; in general, availability of software is most important.

Very large data (greater than 1 terabyte or TB) can be a challenge to preserve as there often fees and additional resources required. One option to consider, institutions often offer solutions for data preservation and compliance. Again, refer to the <u>journal specific guidance</u> for more information or email DataHelp@agu.org.

Sharing Detailed Research Data Is Associated with Increased Citation Rate

Heather A. Piwowar

Roger S. Day, Douglas B. Fridsma

Published: March 21, 2007 • DOI: 10.1371/journal.pone.0000308 • Featured in PLOS Collections

Principal Findings

We examined the citation history of 85 cancer microarray clinical trial publications with respect to the availability of their data. The 48% of trials with publicly available microarray data received 85% of the aggregate citations. Publicly available data was significantly (p = 0.006) associated with a 69% increase in citations, independently of journal impact factor, date of publication, and author country of origin using linear regression.

Part 3: Exploratory data analysis

Research question 1: Relationship between sleep and general health

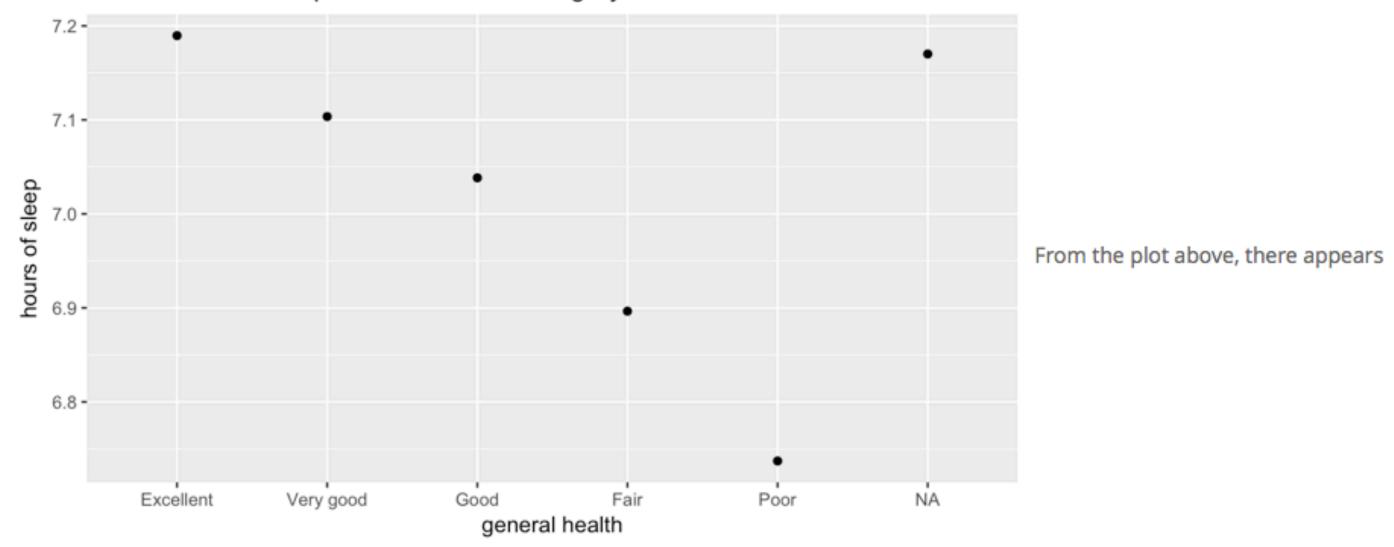

```
#Remove outliers (can't really sleep more than 24hours)
sleeptime <- filter(brfss2013, sleptim1<=24)

## Warning: package 'bindrcpp' was built under R version 3.2.5</pre>
```

```
# Summarize the data
healthSleep <- sleeptime %>%
    group_by(genhlth) %>%
    summarise(meanSleep = mean(sleptim1))

#Plot the general health/mean of sleep time
ggplot(healthSleep, aes(genhlth, meanSleep)) + geom_point(aes(genhlth, meanSleep)) +
    labs(title="mean hours of sleep for each health category", x = 'general health', y='hours of sleep')
```

mean hours of sleep for each health category

to be a general correlation between health and the amount of sleep.

Recommended: CC-BY and CC0

Attribution CC BY

This license lets others distribute, remix, tweak, and build upon your work, even commercially, as long as they credit you for the original creation. This is the most accommodating of licenses offered. Recommended for maximum dissemination and use of licensed materials.

CC0 (datasets)

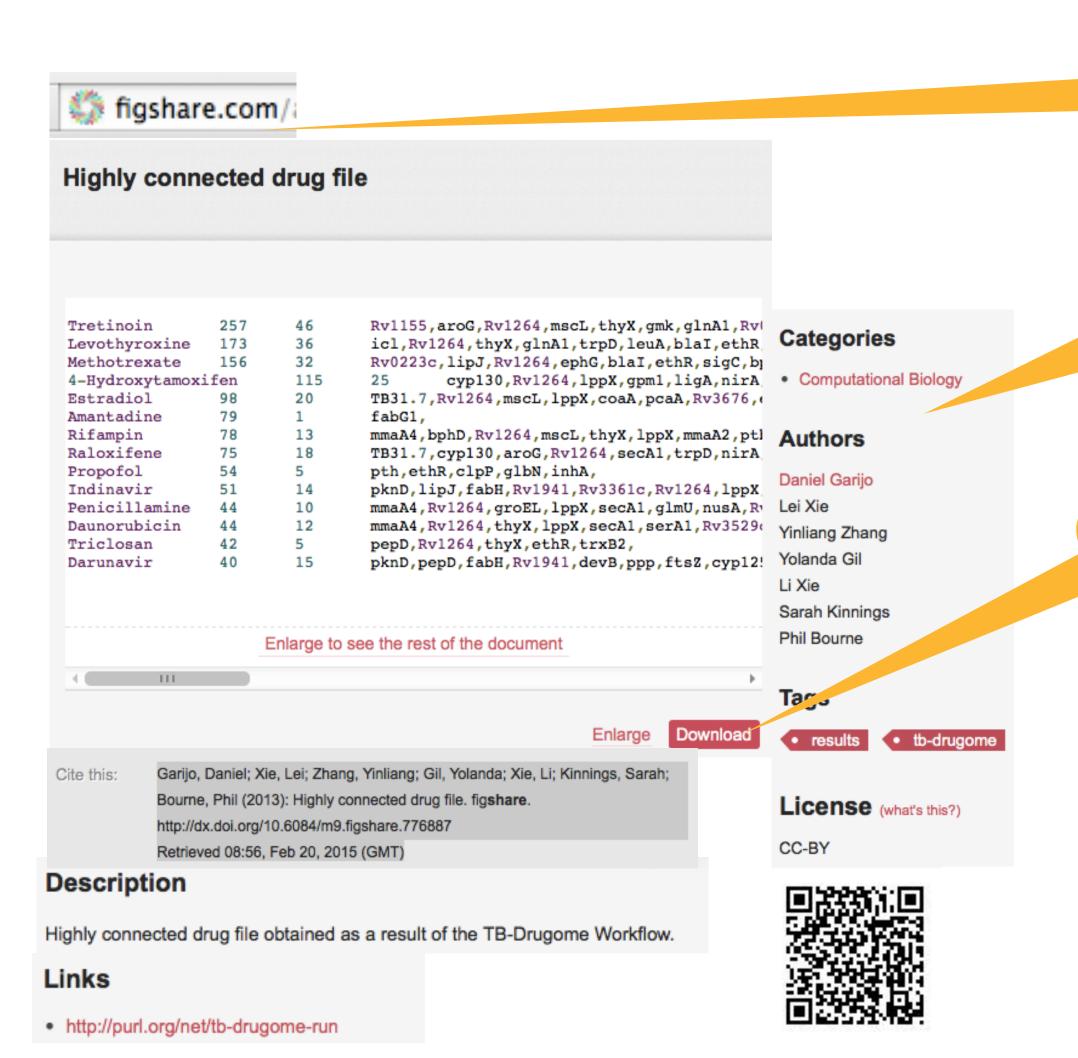

CC0 can be particularly important for the sharing of data and databases, since it otherwise may be unclear whether highly factual data and databases are restricted by copyright or other rights.

Databases may contain facts that, in and of themselves, are not protected by copyright law.

CC0 is recommended for data and databases and is used by hundreds of organizations. It is especially recommended for scientific data. Although CC0 doesn't legally require users of the data to cite the source, it does not take away the moral responsibility to give attribution, as is common in scientific research.

Turn a Git repo into a collection of interactive notebooks

How it works

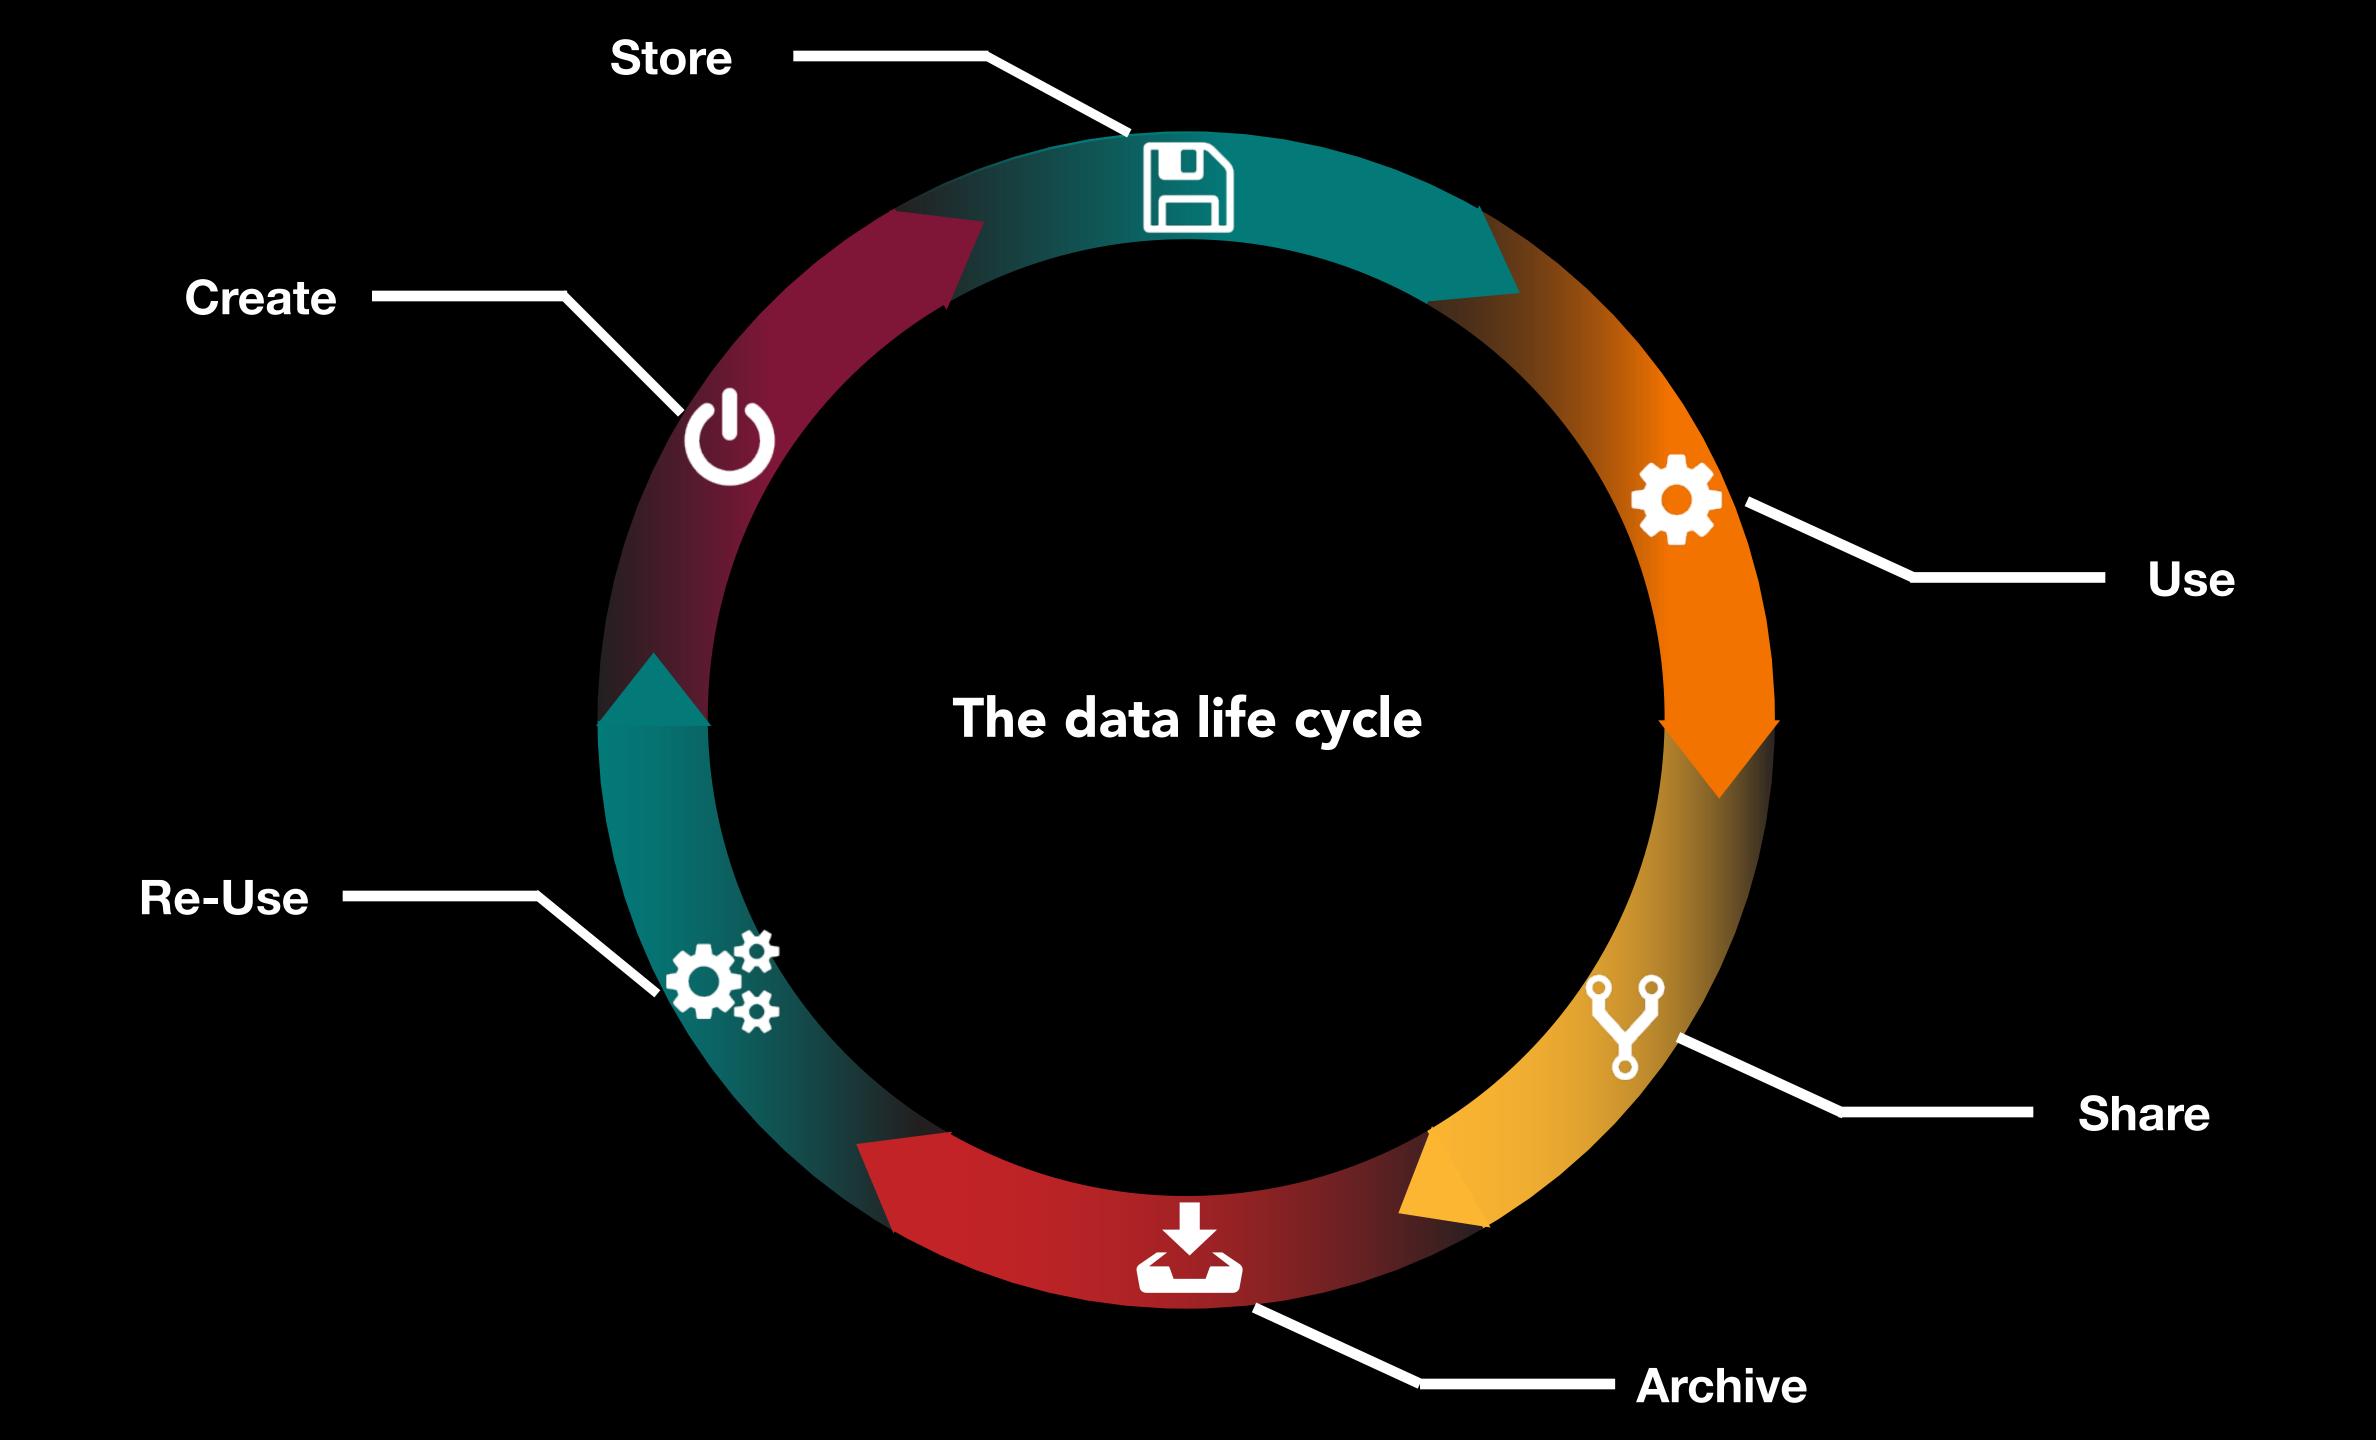

- Enter your repository information

 Provide in the above form a URL or a GitHub repository that contains

 Jupyter notebooks, as well as a branch, tag, or commit hash. Launch will build your Binder repository. If you specify a path to a notebook file, the notebook will be opened in your browser after building.
- We build a Docker image of your repository

 Binder will search for a dependency file, such as requirements.txt or environment.yml, in the repository's root directory (more details on more complex dependencies in documentation). The dependency files will be used to build a Docker image. If an image has already been built for the given repository, it will not be rebuilt. If a new commit has been made, the image will automatically be rebuilt.
- Interact with your notebooks in a live environment!

 A JupyterHub server will host your repository's contents. We offer you a reusable link and badge to your live repository that you can easily share with others.
