MPV	5.3	5.2	4.9	3.8-6.0	fL

Synthesis and Characterization of target oligomers. IR-Y6 was synthesized via a Knoevenagel condensation reaction according to the previously reported method ¹H NMR (Bruker AVANCE III 500 MHz, CDCl₃) δ : 9.18 (s, 2H), 8.60- 8.56 (m, 2H), 7.71 (t, J = 7.1 Hz, 2H), 4.80-4.73 (m, 4H), 3.25 (t, J = 7.7 Hz, 4H), 2.12-2.03 (m, 3H), 1.95-1.83 (m, 5H), 1.41-1.13 (m, 37H), 1.01 (dd, J = 14.6, 7.3 Hz, 9H), 0.87 (t, J = 6.7 Hz, 7H), 0.74 (dd, J = 13.5, 6.9 Hz, 6H), 0.66 (dd, J = 12.3, 7.1 Hz, 6H). High-resolution mass spectra (MALDI-TOF MASS) calculated m/z for [C₈₂H₈₆F₄N₈O₂S₅] calculated 1450.544, found (m/z): 1450.5440.

Methods

¹H-NMR spectra of compounds was performed with Bruker Avance III 400/500 spectrometer. Mass spectrometric (MS) data were carried out using Waters MALDI micro MX, America. Absorption and emission spectra were performed with a Lambda UV-visible spectrophotometer (PerkinElmer) and a VAEIAN CARY Eclipse fluorescence spectrophotometer (Serial No. FL0812-M018), respectively. Steady-state fluorescence spectra and time-resolved luminescence spectra were recorded on a fluorometer named Cary Eclipse from Agilent Tech. Data were obtained under the control of a Windows-based PC by running the manufacturers' supplied software. Nanosecond fluorescence lifetimes were performed using the TCSPC technique on HORIBA Jobin Yvon IBN photo counting fluorescence system with nano LED laser excitation at 455 nm, and microsecond fluorescence lifetimes were performed using spectra LED laser excitation at 460 nm. The molecular geometries calculations, including density functional theory and potential energy curves, were done with the Gaussian 09 suite. The molecular dynamic (MD) simulation was performed using Gromacs (Version 5.1.4) package. Confocal laser scanning microscope (CLSM) images were performed on Olympus FV3000 confocal laser scanning microscope. Photoacoustic imaging was carried out by the InVision 128 MSOT system (iTheraMedical, Germany). A laser at λ = 808 nm was employed as the light source for in vitro and in vivo experiments. The output power of the laser was controlled by a fiber coupled laser system (FCW-808-30W, Changchun New Industries

Optoelectronics Technology) and measured by a power meter (CEL-NP2000, Beijing Zhongjiao Jinyuan Technology Co., Ltd.). The temperature changes were monitored by FLIR-1910582 thermal camera.

The imaging of IR-Y6 NPs distribution in the main organs of mice

In order to more intuitively observe the distribution of nanoparticles in the main organs of mice, IR-Y6 and FITC (mass fraction of 10:1) were simultaneously prepared into nanoparticles (IR-Y6&FITC NPs) by DSPE-PEG2000 as encapsulating material. Fluorescein isothiocyanate (FITC) has been widely used for its excellent photoluminescence properties. Its maximum absorption wavelength is 490~495 nm, and the maximum emission wavelength is 525~530 nm. IR-Y6&FITC NPs has both optical absorption properties and fluorescence properties of FITC with maximum emission of 525~530 nm. 4T1-Tumor-bearing mice was injected IR-Y6&FITC NPs (150 μ L, 1 mg mL⁻¹), after 12 h injection, all the mice were euthanized and their major organs and tumor were dissected and imaged by using Living Imaging System (LB983 NC100).

Photothermal conversion efficiency calculation

The photothermal conversion efficiencies (η) were measured according to the reported method:

$$\eta = \frac{hs(T_{\text{Max}} - T_{\text{Surr}}) - Q_{\text{Dis}}}{I(1 - 10^{-A_{808}})} \quad (\text{S1})$$

h is the heat transfer coefficient; s is the surface area of the container. Q_{Dis} represents heat dissipated from the laser mediated by the solvent and container. I is the laser power and A is the absorbance at 808 nm.

$$hs = \frac{mC_{\text{water}}}{\tau} \quad (\text{S2})$$

m is the mass of the solution containing the photoactive material, C is the specific heat capacity of the solution ($C_{\text{water}} = 4.2 \text{ J/(g}\cdot\text{°C)}$), and τ is the associated time constant.

$$t = -\tau \ln \theta \quad (\text{S3})$$

θ is a dimensionless parameter, known as the driving force temperature

$$\theta = \frac{T - T_{\text{Surr}}}{T_{\text{Max}} - T_{\text{Surr}}} \quad (\text{S4})$$

T_{max} and T_{Surr} are the maximum steady state temperature and the environmental temperature, respectively.
