

Supplementary Tables S1 and S2

Freshwater microbial eukaryotic core communities, open-water and under-ice specialists in
southern Victoria Island lakes (Ekaluktutiak, Nunavut, Canada)

Marianne Potvin¹, Milla Rautio^{2,3,4}, Connie Lovejoy¹

Supplementary Table S1: Read results of from the pooled libraries of individual lakes sampled on a given day. Lake sample abbreviations as in Figure 1. The order of the in the table follows the Bray-Curtis clustering from Figure 2. Three to ten separate libraries were generated for each date-lake combination using available samples. . Raw reads (reads retrieved from Illumina MiSeq platform), filtered reads (merged reads that passed quality filters and chimera removal), final reads (non-targeted reads removed). Source of nucleic acids (RNA or DNA) followed by size fraction as a subscript (L or S for large or small). In 2015 additional depth samples were collected from Greiner lake and the depth for these samples given as the leading 2 place (0, 4 or 8 m).

¹ There were 2 replicate filters collected and processed separately.

² An additional non size fractionated sample (total DNA) was collected and processed separately

³ For some samples, not all extracted DNA could be amplified and only 3 source libraries were available.

Supplementary Table S2: Top 10 contributor OTUs to SIMPER results. Contribution to explanatory value (contr) and standard deviation (sd) and ratio is contribution divided by the standard deviation. The average abundance per group a (ava) and group b (avb). Cumulative sum of the explanatory contribution (cumsum), significance value (*p*). Taxonomy from group (Group Figure 4, the core classifications are from Figure 5: Year-round/Generalist (green), Open-water (orange), Under-ice (blue), no core/not significant indicator (grey). Colors under Group correspond to taxonomic color codes in Figures 5.

| Comparison | OTU_ID | contr | sd | ratio | ava | avb | cumsum | p | Taxonomy | Group | 100% | CLAM | IndVal |
