## General Information

Solvents were obtained from Sigma-Aldrich, Alfa-Aesar and Acros and used directly without further purification. Amino acids and derivatives were obtained from commercial sources. EDCI ( $N$-(3-Dimethylaminopropyl)- $N$ '-ethylcarbodiimide hydrochloride), silver acetate, HFIP (hexafluoro-2-propanol) and aryl iodides were commercially available and used without any purification. Analytical thin layer chromatography was performed on 0.25 mm silica gel $60-\mathrm{F} 254$. ${ }^{1} \mathrm{H}$ spectra were recorded on Bruker AMX-400 instrument ( 400 MHz ), and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker DRX-600 instrument ( 150 MHz ) and were fully decoupled by broadband proton decoupling. Chemical shifts were reported in ppm referenced to tetramethylsilane. The following abbreviations (or combinations thereof) were used to describe multiplicities: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad. Coupling constants, $J$, were reported in Hertz unit (Hz). High-resolution mass spectra (HRMS) were recorded on an Agilent Mass spectrometer using ESI-TOF (electrospray ionization-time of flight). HPLC profiles were obtained on a Hitachi LaChrom Elite HPLC system using commercially available chiral columns.

## Experimental Procedures and Characterization of Compounds

## General Procedure for the Preparation of Substrates

To a solution of $O$-benzyl-lactic acid ( 1.0 equiv), amino acid ester hydrochloride (1.4 equiv), 1-hydroxybenzotriazole hydrate ( 1.05 equiv) and 4-methylmorpholine ( 1.8 equiv) in DMF ( 0.3 M ) was added 1-ethyl-3-[3-(dimethylamino)- propyl]carbodiimide hydrochloride ( 1.2 equiv) at $0{ }^{\circ} \mathrm{C}$. After 1 h at $0{ }^{\circ} \mathrm{C}$ and 3 h at room temperature, the mixture was partitioned between EtOAc and $\mathrm{H}_{2} \mathrm{O}$. The EtOAc extract was washed successively with $\mathrm{H}_{2} \mathrm{O}, 0.5 \mathrm{~N} \mathrm{HCl}, \mathrm{H}_{2} \mathrm{O}$, saturated aqueous $\mathrm{NaHCO}_{3}$, and brine and then dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated to give the corresponding esters as oil. To a solution of the intermediate ester in methanol ( $4 \mathrm{~mL} / \mathrm{mmol}$ ), lithium hydroxide monohydrate ( 4.0 equiv) was added. After 4 h at room temperature, methanol was removed under reduced pressure. $\mathrm{H}_{2} \mathrm{O}$ was added to the crude residue and was subsequently neutralized by the addition of 0.5 N HCl . The aqueous solution was then extracted three times with EtOAc, and the combined organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, concentrated in vacuo to give the crude product which was recrystallized from EtOAc/hexane to give the desired substrates ( $\mathbf{1 a - 1} \mathbf{g}$ ).

## General Procedure for the Optimization of the Amino Acid Auxiliary and the Reaction Conditions

 for the Pd-Catalyzed $\mathbf{C}$-H Arylation of the $\boldsymbol{O}$-benzyl-lactic acid with Amino Acid derivativesA mixture of $1(0.1 \mathrm{mmol})$ and designated amounts of 4-iodotoluene, $\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{AgOAc}, \mathrm{KF}$ in HFIP $(1.0 \mathrm{~mL})$ in a sealed vial was stirred at $100^{\circ} \mathrm{C}$ for 24 h . After cooling down to room temperature, EtOAc $(1.5 \mathrm{~mL})$ and acetic acid $(0.3 \mathrm{~mL})$ were added and the reaction mixture was filtered through a short pad of Celite ${ }^{\circledR}$. The Celite ${ }^{\circledR}$ was washed thoroughly with EtOAc $(4 \times 1.5 \mathrm{~mL})$, and the filtrate was concentrated to dryness.

The Celite was washed thoroughly with EtOAc $(4 \times 1.5 \mathrm{~mL})$. To the combined filtrate was added $2 \mathrm{~N} \mathrm{HCl}(4.5 \mathrm{~mL})$, the layers were separated, and the aqueous layer was extracted with EtOAc ( $3 \times 1.5 \mathrm{~mL}$ ). Combined organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, concentrated and purified by silica gel column chromatography using mixture of hexane, EtOAc and AcOH as eluents (ratios of solvents were varied for different substrates, typically hexane:EtOAc: $\mathrm{AcOH}=100: 100: 0.2$ to 100:100:1).

## Gram-scale Synthesis of 2a

A mixture of $1 \mathrm{a}(1.12 \mathrm{~g}, 4.0 \mathrm{mmol})$, 4-iodotoluene ( $2.62 \mathrm{~g}, 12.0 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}(89.6 \mathrm{mg}, 0.41 \mathrm{mmol})$, $\mathrm{AgOAc}(2.01 \mathrm{~g}, 12.0 \mathrm{mmol}), \mathrm{KF}(712.6 \mathrm{mg}, 12.3 \mathrm{mmol})$ and HFIP $(40 \mathrm{~mL})$ in a sealed vial was stirred at $100{ }^{\circ} \mathrm{C}$ for 24 h . After cooling down to room temperature, EtOAc $(40 \mathrm{~mL})$ and acetic acid ( 12 ml ) were added and the reaction mixture was filtered through a short pad of Celite ${ }^{\circledR}$. The Celite was washed thoroughly with EtOAc $(4 \times 30 \mathrm{~mL})$. To the combined filtrate was added $2 \mathrm{NHCl}(60 \mathrm{~mL})$, the layers were separated, and the aqueous layer was extracted with EtOAc $(3 \times 30 \mathrm{~mL})$. Combined organic phase was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, concentrated and purified by silica gel column chromatography (hexane:EtOAc: $\mathrm{AcOH}=100: 100: 0.2$ to $100: 100: 0.8$ ) to give 2a as an off-white solid ( $1.04 \mathrm{~g}, 70 \%$ ).
