HT-O2	22.59	86.54	18.30	74.31

*W=aqueous solution, PE= pentyl ethanoate (lipid) solutions

Details on the calculations of each individual rate constant

The rate constants (k) were calculated using conventional transition state theory as:

$$k = \frac{k_B T}{h} e^{-(\Delta G^\ddagger)/RT} \quad (1)$$

where k_B and h are the Boltzmann and Planck constants, T is the temperature (K), and ΔG^\ddagger is the Gibbs free energy of activation, which is calculated as the G difference between transition states and reactants for RAF and HAT reaction paths.

For the electron transfer reactions the barriers were obtained using the Marcus theory as:

$$\Delta G_{ET}^\ddagger = \frac{\lambda}{4} \left(1 + \frac{\Delta G_{ET}^0}{\lambda} \right)^2 \quad (2)$$

In this equation λ is calculated as:

$$\lambda \approx \Delta E_{ET} - \Delta G_{ET}^0 \quad (3)$$

where ΔE_{ET} is the non-adiabatic energy difference between reactants and vertical products. This approach is similar to that previously used by Nelsen and co-workers^{1,2} for a large set of reactions.

The standard state was changed to 1M according to:

$$\Delta G^{1M} = \Delta G^{1atm} - RT \ln(V_M) \quad (4)$$

where V_M represents the molar volume, R is the gas constant and T the temperature in K. In addition, the free volume correction to liquid phase proposed by Benson³ has also been included:

$$\Delta G^{sol} \cong \Delta G^{gas} - RT \left\{ \ln \left[n 10^{(2n-2)} \right] - (n-1) \right\} \quad (5)$$

The limit imposed by diffusion has also been taken into account. To that purpose we used the Collins-Kimball theory:⁴

⁴ F. C. Collins, G. E. Kimball, *J. Colloid Sci.* **1949**, *4*, 425–437.

$$k_{app} = \frac{k_D k}{k_D + k} \quad (6)$$

where k is the thermal rate constant, obtained from TST calculations, and k_D is the steady-state Smoluchowski⁵ rate constant for an irreversible bimolecular diffusion-controlled reaction:

$$k_D = 4\pi R_{AB} D_{AB} N_A \quad (7)$$

where R_{AB} denotes the reaction distance, N_A is the Avogadro number, and D_{AB} is the mutual diffusion coefficient of the reactants A (free radical) and B (scavenger). D_{AB} is calculated from D_A and D_B according to reference,⁶ D_A and D_B are estimated from the Stokes–Einstein approach:^{7,8}

$$D_{A \text{ or } B} = \frac{k_B T}{6\pi\eta a_{A \text{ or } B}} \quad (8)$$

where k_B is the Boltzmann constant, T is the temperature, η denotes the viscosity of the solvent, and a is the radius of the solute.

More details on the used methodology, and on how these equations are obtained can be found elsewhere.⁹
