Preparation of the mouse brains for whole mount immunofluorescence as in Nam and Capecchi, 2020

© Hyung-song Nam, PhD, July 4, 2022

Anesthetize the mouse

Transcardially perfuse the anesthetized mouse with PBS + heparin

Heparin Sigma

H3393

Dissolve 100KU in 5 mL of PBS for a 20KU/mL solution. This is 1000x. Store @ 4 deg C.

Right before perfusions, dilute 1000-fold with PBS. Mix.

Perfuse PLP fixative with 2% formaldehyde (see page 4)

Dissect out the brain

Rinse away the excess fixative with PBS

Place the brain in a dish with PBS

Bisect the brain then dissect the two sides of the brain to reveal the ventricular wall

Post-fix in PLP fixative with 2% formaldehyde on nutator overnight @ 4 deg C

Rinse the brain with 1-2 changes of PBS

Block with 0.3 M glycine in PBS, pH 7.4 (see page 5) on nutator overnight @ 4 deg C

Store the brain in the glycine in PBS buffer @ 4 deg C

When ready to do the staining, transfer to a dish with PBS, dissect away the excess brain tissue

Permeabilize the brain with Triton X-100 in PBS @ room temperature

Immunostain as described in Nam and Capecchi, 2020 (see page 7)

EM-CORE PROTOGOL 08 PLP-Fixative (a.k.a. "Nakane's"): McLean & Nakane (1974) Use: L-Lysine monohydrochloride Sigma L-5626 MW=182.6 Sodium (meta)periodate INaO₄ (also: NaIO₄) Sigma S-1878 MW=213.9 Na₂HPO₄ NaH₂PO₄ Final concentrations: 3% PFA 75 mM L-Lysine 10 mM INaO₄ 0.1 M phosphate buffer To make 100 mL fresh on day of use: 2.7389 5.46 50 mL 0.2 M phosphate buffer pH 7.4 (from stock A+B) 32 mL distilled water 18 mL of 16% PFA 1.369 g L- Lysine -2.738 0.214 g INaO₄ 0. Y 28 VU Check pH; shouldn't be too far from 7.4 50nl 700M adapted from: 2dm 8% 37.5 10 41 McLean IW, Nakane PK. Periodate-lysine-paraformaldehyde fixative. A new fixation for 17041 immunoelectron microscopy. J Histochem Cytochem 1974; 22:1077-108 Timo Protocol # 08 - Filename: 08 - FLP Fixative pages - updated November 1, 2007 TM - page 1 of

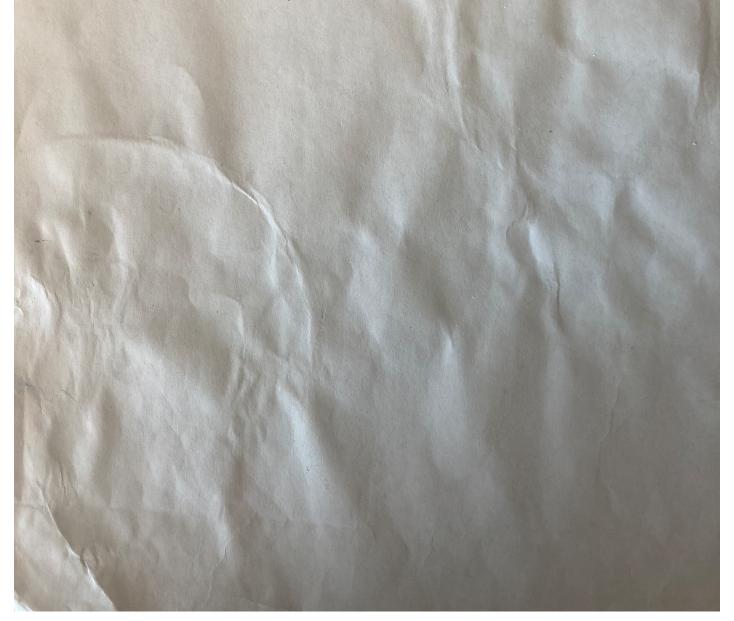

0.2M Phosphate Buffer-4 Liters (pH 7.4):

17.66g Sodium Phosphate Monobasic 90.03g Sodium Phosphate Dibasic Heptahydrate 4 Liters ddH₂O pH should be 7.4, if not adjust with 1.0N NaOH or 1.0N HCl (3 Liters-13.25g Mono and 67.52g Dibasic)

2L 8.835 45.013

0.1 M sodium phosphate buffer (pH 7.4)

Add 3.1 g of NaH₂PO₄•H₂O and 10.9 g of Na₂HPO₄ (anhydrous) to distilled H₂O to make a volume of 1 L. The pH of the final solution will be 7.4. This buffer can be stored for up to 1 mo at 4°C.

Here is what I do to make the fixative in Nam and Capecchi, 2020

Make 2x PB buffer with lysine and sodium metaperiodate, cool on ice Make 2x formaldehyde in water, cool on ice

Right before the perfusions, I mix the two, then proceed as described on page 1

To make 100 mL of 2x PB buffer with lysine and periodate Dissolve 2.738 g of lysine (Sigma catalog # L5626) 0.428 g of periodate (Sigma catalog # 71859) in 100 mL 0.2 M (2x) PB, cool on ice

To make 200 mL of 2x PB Buffer with lysine and periodate Dissolve 5.476 g of lysine 0.856 g of periodate in 200 mL 0.2 M (2x) PB, cool on ice

To make 2 L of 0.2 M (2x) PB Dissolve 8.83 g of sodium phosphate monobasic 45.01 g of sodium phosphate dibasic heptahydrate in some purified water

Adjust pH to 7.4 with NaOH, add more water to volume, filter, store at room temperature

To make 4 L of 0.2 M (2x) PB

Dissolve

17.66 g of sodium phosphate monobasic

90.03 g of sodium phosphate dibasic heptahydrate

in some purified water

Adjust pH to 7.4 with NaOH, add more water to volume, filter, store at room temperature

To make 100 mL of 2x formaldehyde (4%)

Dissolve

4 q of paraformadehyde

in some purified water

Heat, add NaOH, wait to dissolve, add more water to volume, cool on ice

To make 200 mL of 2x formaldehyde (4%)

Dissolve

8 g of paraformadehyde

in some purified water

Heat, add NaOH, wait to dissolve, add more water to volume, cool on ice

After the post-fix, I block the brains with glycine in PBS buffer

0.3 M glycine in PBS, pH 7.4.

For 2 L, 45 g glycine.

Dissolve glycine in 1/10 volume of 10x PBS and some purified water, pH to 7.4 with NaOH, bring to volume with more water. Filter. Store @ 4 deg C.

Glycine Sigma ReagentPlus®, ≥99% (HPLC) G7126
