<sup>a</sup>based on the measured concentrations of illicit drugs in influent, primary effluent, effluent, and SPM in this study; <sup>b</sup>based on KOWWIN v1.67 estimate (predicted data from [www.chemspider.com](http://www.chemspider.com), based on USEPA's EPISuite<sup>TM</sup>); <sup>c</sup>based on PCKOCWIN v1.66; <sup>d</sup>based on WSKOW V1.41; <sup>e</sup>stability change in unfiltered raw wastewater at 2 °C after 72 h<sup>18</sup>; <sup>f</sup>excretion profile of illicit drugs (unchanged and metabolite forms) and the ratio of molecular weight of parent illicit drugs and corresponding metabolite(s)<sup>37</sup>; \*excretion data was not available in case of MDA administered as an illicit drug despite the excretion of MDA as a metabolite of MDMA and MDEA were available.

Table S2. Characteristics of WWTPs studied

|                            | WWTP <sub>A</sub>                 | WWTP <sub>B</sub>                |
|----------------------------|-----------------------------------|----------------------------------|
| primary treatment          | settling                          | settling                         |
| secondary treatment        | activated sludge                  | activated sludge                 |
| population served          | 14,675                            | 100,000                          |
| WWTP capacity              | 2.5 MGD                           | 35 MGD                           |
| average flow of wastewater | 1.81 MGD (6852 m <sup>3</sup> /d) | 22 MGD (83279 m <sup>3</sup> /d) |
| % industrial waste         | ~5%                               | ~25%                             |
| hydraulic retention time   | ~24 h                             | ~16 h                            |
| average sludge production  | 928 tons/year                     | 5820 tons/year                   |

Table S3. HPLC mobile phase compositions and programming for illicit drugs (Flow rate = 400 µL/min)

| Time (min) | % A<br>(methanol) | % B<br>(0.1% formic acid in water) |
|------------|-------------------|------------------------------------|
| 0.0        | 5                 | 95                                 |

DP: declustering potential; FP: focusing potential; EP: entrance potential; CP: collision potential; EXP: exit potential

<sup>a</sup>source parameters: ion spray voltage (4500 V) and temperature (450 °C)

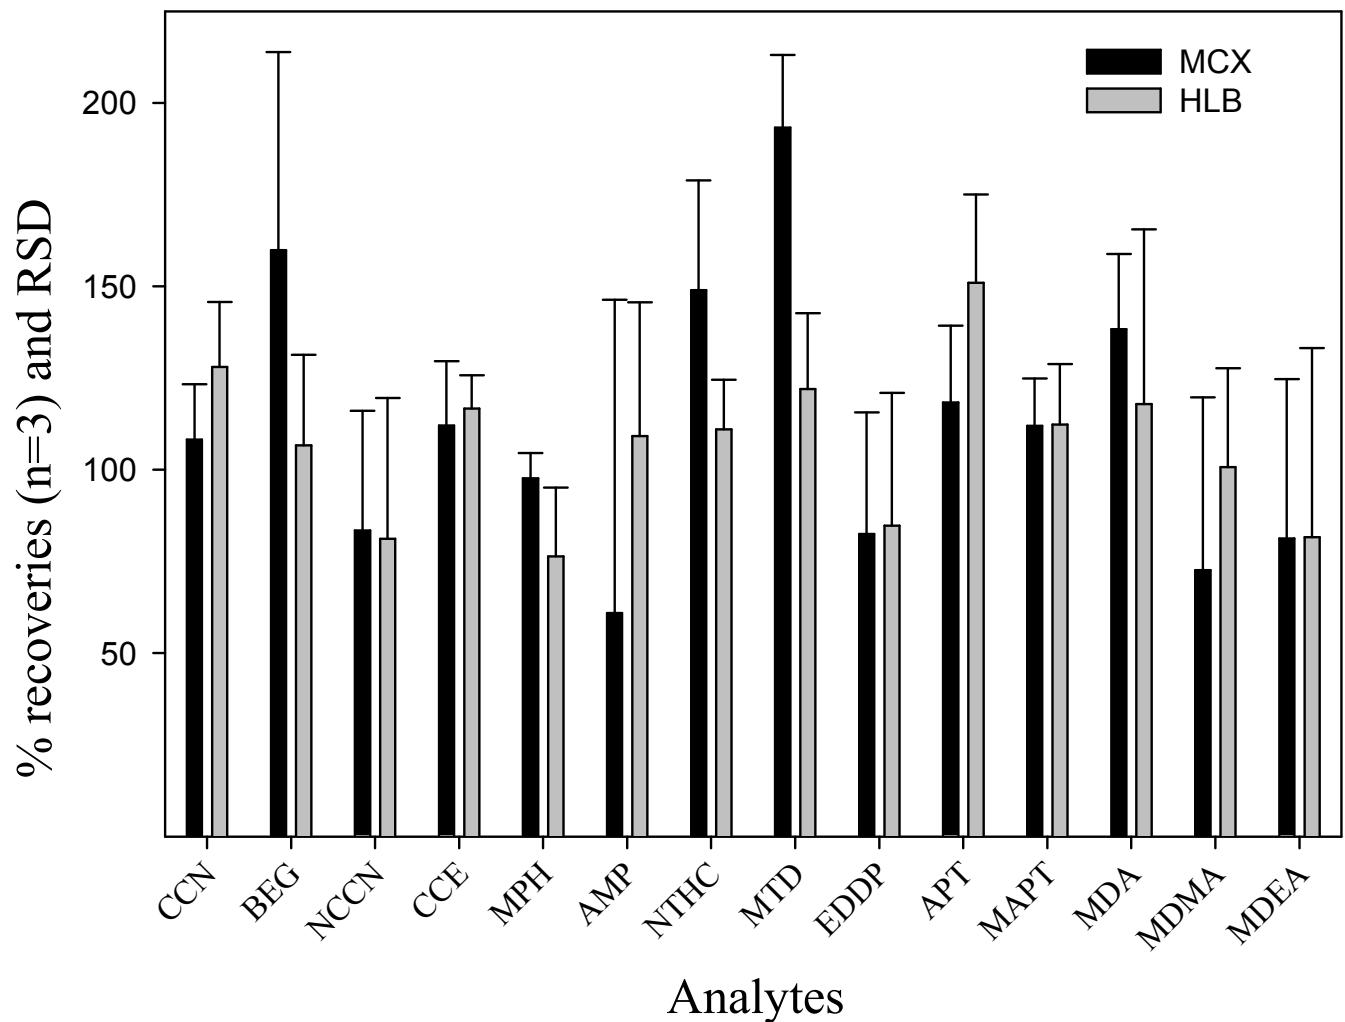

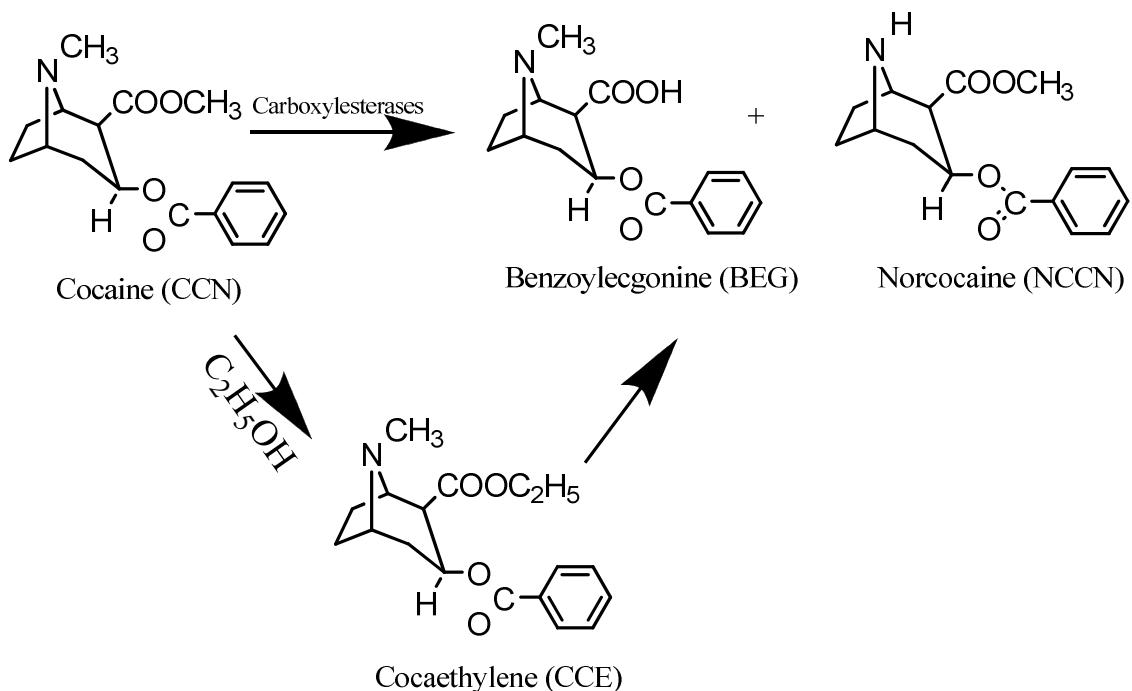

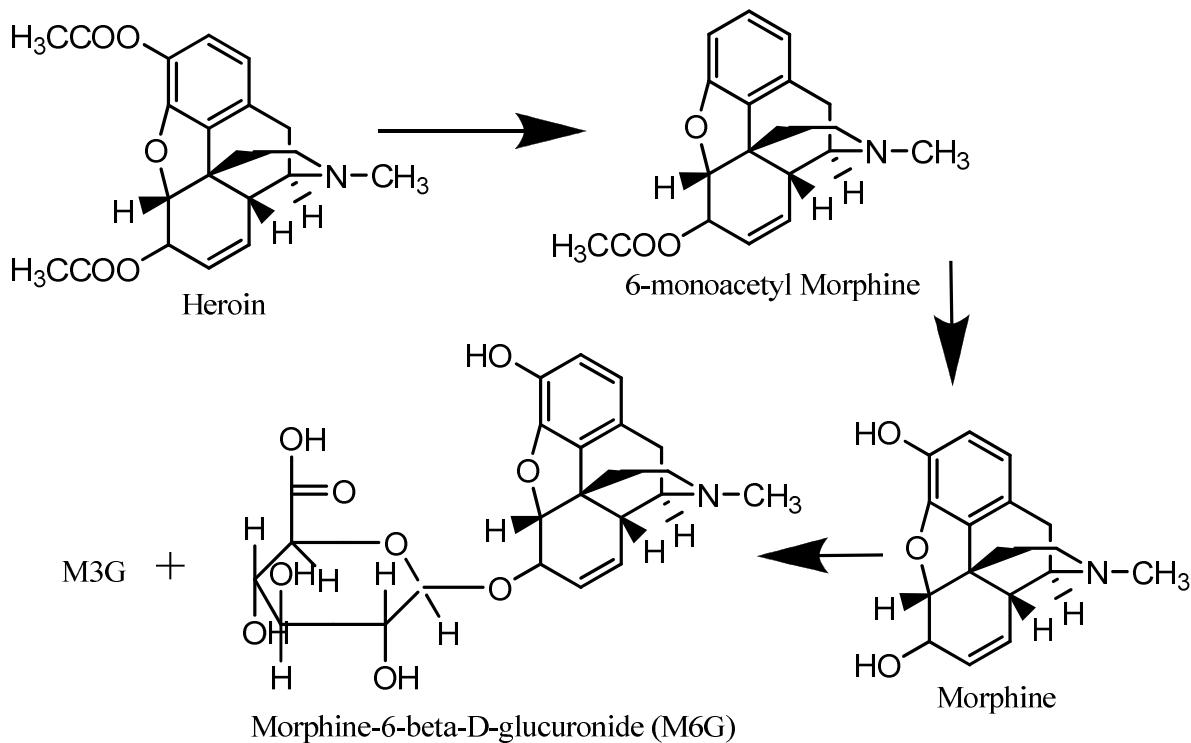

Figure S1: Spiking recoveries and relative standard deviations (n=3) of illicit drugs through MCX and HLB cartridges.

**Frequency and Doses of Use of Illicit Drugs:** The frequency and doses of illicit drugs ingested by the population were calculated based on mass loadings of illicit drugs to the WWTPs and the amount of the drugs ingested for every dose.<sup>37</sup> The estimated number of doses of CCN per day in the communities served by WWTP<sub>A</sub> and WWTP<sub>B</sub> were 165 and 3509, respectively (Table 2). The total number of doses corresponds 1.68 and 5.26% of the population of age 15-64, which is ~4.2-18 times higher than the UNODC's estimation of global CCN consumption (0.3-0.4% of global adult population of age 15-64 in 2011). Similarly, 0.52 and 0.93% of the population served by WWTP<sub>A</sub> and WWTP<sub>B</sub> were found to abuse APT, which was similar to the UNDOC's estimation of 0.7%.<sup>2</sup> The total doses of MPH were found to be 3151 and 29810 in the communities served by WWTP<sub>A</sub> and WWTP<sub>B</sub>, corresponding to 32 and 45% of the population; however, the existence of multiple sources of MPH (as discussed above) suggested that this estimate does not only represent illegal usage but also legal usage.

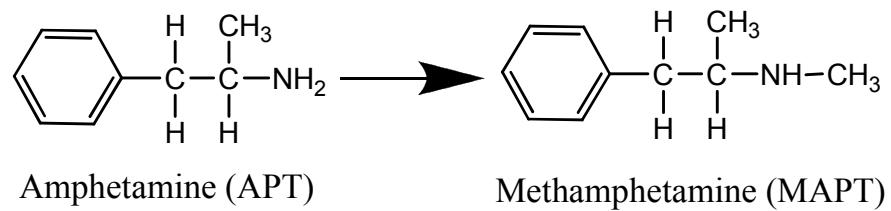

### Metabolization of cocaine (MPH)

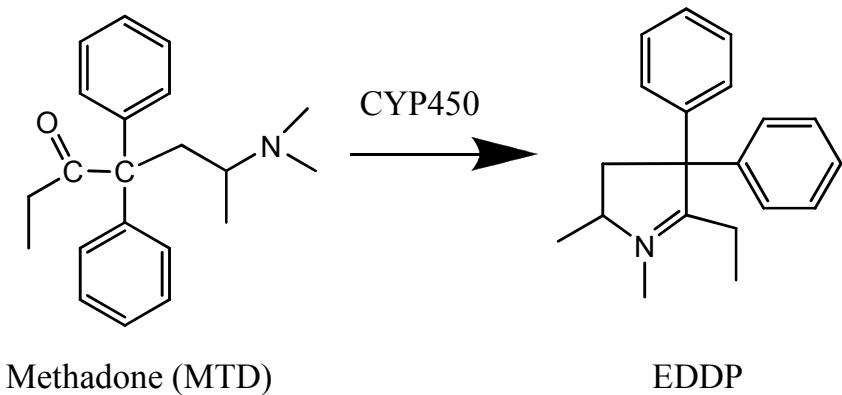

### Metabolization of heroine

Metabolization of amphetamine (APT)

Metabolization of methadone (MTD)

Metabolization of MDMA and MDEA
