### Crystal Structure Refinement

For compound **4c**, anisotropic thermal parameters were used for non-hydrogen atoms. Two propyl groups from the calix[4]arene and phenyl group attached to the phosphine borane adduct exhibit disorder with the ratios 0.50(1) / 0.50(1). The geometric parameters of disordered components in each group were restrained by using SADI<sup>1</sup> restraints and using EADP<sup>1</sup> constraints. Similar U<sup>ij</sup> constraints were applied within the disordered parts to maintain a reasonable model.

For compound (*R*)-**4b**, all non-hydrogen atoms were refined with anisotropic thermal parameters. Hydrogen atoms attached to carbon atoms were included in their calculated positions and refined with a riding model while the H-B distances were refined. The methoxy group included in the anisole group was found disordered over two positions and refined with an occupation factor of 0.54/0.46. In these groups, the oxygen-carbon distance was restrained to 1.42 Å. One propoxy group from the calix[4]arene was found disordered with an occupation factor of 0.55/0.45. All bonds and angles of the four propoxy group linked to the calix[4]arene were restrained to be identical (SAME<sup>1</sup> instruction).

For compound **8c**, anisotropic thermal parameters were used for non-hydrogen atoms. One dichloromethane molecule, two cyclopentadienyl groups linked to Fe(1) and the ending propyl carbon C33 from the calix[4]arene exhibit disorder with the ratios 0.60(1) / 0.40(1), 0.65(1) / 0.35(1) and 0.73(1) / 0.27(1) respectively. The geometric parameters of disordered components in each group were restrained by using EADP<sup>1</sup> constraints. SADI<sup>1</sup> restraints were used only for the ending propyl group containing C32 and C33. Similar U<sup>ij</sup> constraints were applied within the disordered parts to maintain a reasonable model. H atoms on boron atom B2 seemed to be disordered over two positions in the Fourier difference map and for this reason idealized methyl group were placed over two positions.

For compound **11**, all non-hydrogen atoms were refined with anisotropic thermal parameters. Hydrogen atoms attached to carbon atoms were included in their calculated positions and refined with a riding model while the B-H distances were refined. The methoxy group included in the anisyl group was find disordered over two positions and refined with an occupation factor of 0.59/0.41. In these groups, the oxygen-carbon distance was restrained to 1.42Å. Two propoxy group from the calix[4]arene were found disordered with an occupation factor equal respectively to 0.66/0.34 and 0.72/0.28. All bonds ans angles of the four propoxy group linked to the calix[4]arene were restrained to be identical (SAME<sup>1</sup> instruction).

**Table S16.** Anisotropic displacement parameters ( $\text{\AA}^2 \times 10^3$ ) for compound 11 (et jug1).

The anisotropic displacement factor exponent takes the form:  
 $-2 \pi^2 [ h^2 a^{*2} U_{11} + \dots + 2 h k a^* b^* U_{12} ]$
