## **1.0 General Methods**

All reactions were carried out under an argon atmosphere condition unless otherwise noted and solvents were dried according to established procedures. Reactions were monitored by thin layer chromatography (TLC), column chromatography purifications were carried out using silica gel GF254. Proton nuclear magnetic resonance (<sup>1</sup>H NMR) spectra were recorded on Brucker 300 MHz spectrometer in CDCl<sub>3</sub> unless otherwise noted and carbon nuclear magnetic resonance (<sup>13</sup>C NMR) spectra were recorded on Brucker 300 MHz spectrometer in CDCl<sub>3</sub> using tetramethylsilane (TMS) as internal standard unless otherwise noted. Data are presented as follows: chemical shift, integration, multiplicity (br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, cm = complex multiplet) and coupling constant in Hertz (Hz). Infrared (IR) spectra were recorded on a FT-IR spectrometer. Optical rotations were recorded on a Perkin-Elmer 341 polarimeter. HR-MS was measured with an APEX II 47e mass spectrometer. Melting points were measured on an XT-4 melting point apparatus and were uncorrected. The ee values determination was carried out using chiral high-performance liquid chromatography (HPLC) with Daicel Chiracel AD-H or OD-H column on Waters with a 2996 UV-detector. *N*-aryl tetrahydroisoquinolin, and organocatalysts **4h-n** were prepared according to the previous reported procedures.<sup>[1], [2], [3], [4], [5]</sup>

#### **4.0 General Procedure for the Preparation of Optically Active C<sub>1</sub>-alkene Tetrahydroisoquinolins**

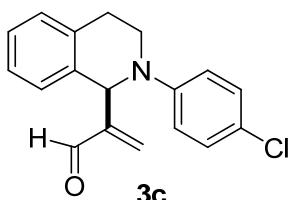

Typical experimental procedure: Under O<sub>2</sub>, a solution of Cu(OTf)<sub>2</sub> (0.01 mmol) and chiral ligand **4b** (0.012 mmol) in anhydrous DCM (0.4 mL) was stirred at room temperature for 0.5 h, and then the mixture was added to a Schlenk tube which were charged with aryl-substituted 1,2,3,4-tetrahydroisoquinolin **1** (0.1 mmol), 4 Å molecular sieve (100 mg), anhydrous Na<sub>2</sub>SO<sub>4</sub> (0.3 mmol), anhydrous DCM (0.4 mL) and O<sub>2</sub> (1 atm). Finally, a solution of unsaturated carbonyl compounds **2** (0.1 mol) in anhydrous DCM (0.2 mL) was slowly added to the mixture above prepared and the resultant reaction mixture was stirred at room temperature for the appropriate time. After the reaction was completed (monitored by TLC), the resulting mixture was concentrated under reduced pressure and the residue was purified through column chromatography on silica gel (eluent, ethyl acetate / hexane 1:7). After filtration and the solvent was removed at reduced pressure to give the pure products.

## 5.0 Transformation of 3k to 8a<sup>[6], [7]</sup>

A mixture of **3a** (0.2 mmol) and LiAlH<sub>4</sub> (0.6 mmol) in the solution of ether (5.0 ml) was stirred at room temperature for 30 min. After the reaction completed, 5 ml water was slowly added to the mixture at 0°C, then the mixture was extracted with ether (5 ml ×3). The combined organic extracts were washed with brine, and then dried over Na<sub>2</sub>SO<sub>3</sub>, and concentrated to give yellow oil. The residue was used without further purified. To the mixture of the residue in anhydrous propan-2-ol was added the solution of RuCl<sub>2</sub>(PPh<sub>3</sub>)<sub>3</sub> (1.0 % mol) and Cs<sub>2</sub>CO<sub>3</sub> (2.0 % mol) in anhydrous propan-2-ol, and the mixture was stirred at 82°C for 9h. After the reaction completed, the mixture was concentrated under reduced pressure, and the residue was purified through column chromatography on silica gel (eluent, ethyl acetate / hexane 1:5). After filtration and the solvent was removed at reduced pressure to give the pure products **8a** as colorless oil (over all yield: 86%).
