## Supporting Information

General procedures. All reactions were carried out under a nitrogen atmosphere with dry solvents under anhydrous conditions, unless otherwise noted. Dry tetrahydrofuran (THF), diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$, dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$, benzene, toluene, acetonitrile $(\mathrm{MeCN}), \mathrm{N}, \mathrm{N}-$ dimethylformamide (DMF) and methanol ( MeOH ) were obtained by passing commercially available pre-dried, oxygen-free formulations through activated alumina columns unless otherwise stated. Yields refer to chromatographically and spectroscopically ( ${ }^{1} \mathrm{H}$ NMR) homogeneous materials, unless otherwise stated. Reagents were purchased at the highest commercial quality and used without further purification, unless otherwise stated. Reactions were monitored by thin layer chromatography (TLC) carried out on 0.25 mm E. Merck silica gel plates (60F-254) using UV light as visualizing agent and an ethanolic solution of phosphomolybdic acid and cerium sulfate; $p$-anisaldehyde in ethanolic $\mathrm{HOAc} / \mathrm{H}_{2} \mathrm{SO}_{4}$; or potassium permanganate in aqueous NaOH as developing agents. NMR spectra were recorded on Bruker DRX 600, DRX 500, AMX 400, or Varian INOVA 400 instruments and calibrated using residual undeuterated solvent as an internal reference. The following abbreviations were
used to explain the multiplicities: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet, b $=$ broad. IR spectra were recorded on a Perkin-Elmer Spectrum BX FT-IR instrument. High resolution mass spectrometry data (HRMS) were recorded on a VG ZAB-ZSE mass spectrometer using MALDI (matrix assisted laser desorption ionization). Melting points (m.p.) are uncorrected and were recorded on a Fisher-Johns 12-144 melting point apparatus. LCMS data were recorded on an Agilent 1100 series LC system coupled to an ESI Agilent MSD.

General procedure for nitroso ene reaction (synthesis of compounds 10,
$\mathbf{1 2}, \mathbf{1 4}, \mathbf{1 6}, \mathbf{1 8}, \mathbf{2 0}, \mathbf{2 2})$. To a solution of $\mathbf{9}(149 \mathrm{mg}, 0.54 \mathrm{mmol})$ and
nitrosobenzene ( $145 \mathrm{mg}, 1.35 \mathrm{mmol}$, 2.5 equiv) in toluene $\left(4 \mathrm{~mL}, 0.14 \mathrm{M}\right.$ ) at $0{ }^{\circ} \mathrm{C}$ was added $\mathrm{ZrCl}_{4}$ ( $126 \mathrm{mg}, 0.54 \mathrm{mmol}, 1.0$ equiv) in one portion. The cooling bath was removed and he reaction mixture was stirred for two hours and turned from an initial green color to dark brown. Once the reaction was complete as judged by TLC, the reaction mixture was filtered through Celite ${ }^{\square}$ and concentrated. The crude residue was purified by flash column chromatography (silica gel, 10:1 $\square$ 2:1 hexanes:EtOAc) and crystallized from 1:1 hexanes:EtOAc furnishing 120 $\mathrm{mg}(81 \%)$ of $\mathbf{1 0}$ : white cubes; m.p. $=200-202{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}=0.30$ (silica gel, $2: 1$ hexanes:EtOAc); IR (film) $\square_{\max } 3302,2954,2260,1706,1684,1618,1508,1458,1431,1329,1272,1224,1132$, 1056, $722 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $d_{6}$ ) $\square 8.78(\mathrm{bs}, 1 \mathrm{H}), 7.88(\mathrm{~s}, 1 \mathrm{H}), 7.77(\mathrm{~d}, J=8.0$ $\mathrm{Hz}, 1 \mathrm{H}), 7.73(\mathrm{~s}, 1 \mathrm{H}), 7.48(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}) 7.15(\mathrm{t}, J=7.2 \mathrm{~Hz}, 1$ H), $3.75(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{bs}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz , DMSO- $d_{6}$ ) $\square 165.8,155.2$, 135.6, 128.6, 126.9, 122.3, 120.4, 120.0, 119.8, 118.1, 112.0, 108.8, 51.8 (2 C); HRMS (ESI-TOF) calculated for $\mathrm{C}_{14} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{Na}\left[\mathrm{M}+\mathrm{Na}^{+}\right]$297.0846, found 297.0848.

Prenylated proline 26. To a solution of $23(4.74 \mathrm{~g}, 20.7 \mathrm{mmol})$ in THF ( $21 \mathrm{~mL}, 1$ $M)$ at $-78{ }^{\circ} \mathrm{C}$ was added LHMDS (22.8 mL from a 1.0 M solution, $22.8 \mathrm{mmol}, 1.1$ equiv) over 5 min . After the addition, the reaction mixture was maintained at $-78{ }^{\circ} \mathrm{C}$ and allowed to react for 35 min , during which time the solution turned yellow. To the resulting enolate was added prenyl bromide ( $2.63 \mathrm{~mL}, 22.7 \mathrm{mmol}$, 1.1 equiv) over 5 min . After the addition, the cooling bath was removed and the reaction was allowed to warm to room temperature. After 2 h , the reaction was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{~mL})$, followed by $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{~mL})$. The product mixture was extracted with EtOAc (3 $\left.\square 100 \mathrm{~mL}\right)$ and the combined EtOAc layers were washed with saturated aqueous $\mathrm{NaCl}(200 \mathrm{~mL})$, dried with anhydrous $\mathrm{MgSO}_{4}$, concentrated in vacuo, and purified by flash column chromatography (silica gel, $6: 1$ hexanes:EtOAc) furnishing $5.11 \mathrm{~g}(83 \%)$ of $\mathbf{2 5}$ as a clear colorless oil. To a solution of this compound $(5.11 \mathrm{~g}, 17.2 \mathrm{mmol})$ in toluene $(84 \mathrm{~mL}, 0.2 \mathrm{M})$ was added $p-\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}(3.27$, $17.2 \mathrm{mmol}, 1.0$ equiv). The resulting suspension was stirred vigorously and heated at reflux whereupon the acid dissolved. After 2.5 h , the reaction was deemed complete by TLC and the solvent was removed in vacuo. The residue was dissolved in $\mathrm{CHCl}_{3}(100 \mathrm{~mL})$ and ammonia was bubbled through the suspension for 20 min , during which time the mixture became a cloudy, white suspension. The reaction mixture was filtered and the cake was rinsed with additional $\mathrm{CHCl}_{3}(50 \mathrm{~mL})$. Compound 44. To a solution of 43 (diastereomers of $\mathbf{4 3}$ were carried forward independently; $710 \mathrm{mg}, 1.05 \mathrm{mmol}$ ) in THF ( $11 \mathrm{~mL}, 0.1 M$ ) was added TBAF ( 3.15 mL from a 1 M solution in THF, $3.15 \mathrm{mmol}, 3.0$ equiv). All starting material was consumed after 2 h as judged by TLC. The reaction was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$. The mixture was diluted with $\mathrm{H}_{2} \mathrm{O}: \mathrm{EtOAc}$ $(1: 1,50 \mathrm{~mL})$ and the layers were separated. The aqueous portion was extracted with EtOAc (2 $\square$ $30 \mathrm{~mL})$. The combined organic portions were washed with saturated aqueous $\mathrm{NaCl}(30 \mathrm{~mL})$, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The resulting crude alcohol was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(11 \mathrm{~mL}, 0.1 \mathrm{M})$. Dess-Martin periodinane ( $0.490 \mathrm{~g}, 1.16 \mathrm{mmol}, 1.1$ equiv) was added and the mixture was stirred open to the atmosphere. After 1.5 h , all starting material had been consumed as judged by TLC. The reaction mixture was poured into a separatory funnel and diluted with saturated aqueous $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$. The layers were separated and the aqueous portion was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \square 20 \mathrm{~mL})$. The combined organic layers were washed with saturated aqueous $\mathrm{NaCl}(100 \mathrm{~mL})$, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. After 30 min , all starting material had been consumed as judged by TLC and the reaction mixture was diluted with $\mathrm{H}_{2} \mathrm{O}$ $(20 \mathrm{~mL})$ and EtOAc $(20 \mathrm{~mL})$ and the layers were separated. The aqueous portion was back extracted with EtOAc ( 20 mL ). The combined organic layers were washed with saturated aqueous $\mathrm{NaCl}(40 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo to approximately 10 mL . This crude solution was diluted with MeOH :benzene $(1: 1,20 \mathrm{~mL})$ and cooled to $0{ }^{\circ} \mathrm{C}$. Ethereal $\mathrm{CH}_{2} \mathrm{~N}_{2}$ was carefully added dropwise to the stirring solution of crude acid until a yellow color persisted. This mixture was dissolved in benzene $(2.4 \mathrm{~mL}, 0.05 \mathrm{M})$ and Burgess reagent ( $80.3 \mathrm{mg}, 0.337 \mathrm{mmol}$, 3.0 equiv) was added. The flask was sealed and introduced in to an oil bath preheated to $50{ }^{\circ} \mathrm{C}$, heating for 20 min . The mixture was concentrated and purified by flash column chromatography (silica gel, 2:1 hexane:EtOAc $\square$ 1:3 hexane:EtOAc) furnishing $26.5 \mathrm{mg}(41 \%)$ of 46 and 25 mg (39\%) of the corresponding methyl ketone.

Tryptophan derivative 56. $N$-Cbz-L-pyroglutamate methyl ester (100 $\mathrm{mg}, 360 \mu \mathrm{~mol}$ ) was dissolved in THF ( $3.6 \mathrm{~mL}, 0.1 \mathrm{M}$ ) and cooled to -78 ${ }^{\circ} \mathrm{C}$. After 10 min of stirring, saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}(5 \mathrm{~mL})$ was added to the cold reaction solution. The reaction was allowed to warm to ambient temperature and $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and EtOAc $(10 \mathrm{~mL})$ were added. The layers were separated and the aqueous layer was extracted with EtOAc ( 10 mL ). The organic layers were combined and washed with saturated aqueous $\mathrm{NaCl}(15 \mathrm{~mL})$, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. To the resultant crude clear oil was added compound $\mathbf{5 5}$ ( $156 \mathrm{mg}, 0.40 \mathrm{mmol}, 1.1$ equiv), diazabicyclo[2.2.2]octane (DABCO, $120 \mathrm{mg}, 1.1 \mathrm{mmol}, 3.0$ equiv), and TBAI ( $133 \mathrm{mg}, 0.36 \mathrm{mmol}, 1.0$ equiv). [^3]h and then extracted with EtOAc (3 $\square 300 \mathrm{~mL}$ ), washed with saturated aqueous $\mathrm{NaCl}(3 \square 500$ mL ), dried with anhydrous $\mathrm{MgSO}_{4}$, concentrated in vacuo, and purified by flash column chromatography (silica gel, 1:4 EtOAc:hexanes) furnishing $0.97 \mathrm{~g}(92 \%)$ of the primary alcohol. To a solution of this alcohol ( $630 \mathrm{mg}, 1.96 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL}, 0.2 \mathrm{M})$ at room temperature, was added imidazole ( $160 \mathrm{mg}, 2.35 \mathrm{mmol}, 1.2$ equiv) and the solution was stirred for 5 min . tert-Butyldimethylsilyl chloride ( $\mathrm{TBSCl}, 325 \mathrm{mg}, 2.16 \mathrm{mmol}, 1.1$ equiv) was then added and the mixture stirred for 30 min . The solution was concentrated in vacuo and purified by flash column chromatography (silica gel, 1:2 EtOAc:hexanes) furnishing the protected alcohol ( $69,0.82 \mathrm{~g}, 96 \%)$. To this alcohol $(\mathbf{6 9}, 700 \mathrm{mg}, 1.60 \mathrm{mmol})$ was added $10 \% \mathrm{Pd} / \mathrm{C}(140$ $\mathrm{mg}, 20 \% \mathrm{w} / \mathrm{w})$. The flask was flushed with nitrogen gas and $\mathrm{MeOH}(20 \mathrm{~mL})$ was added. The flask was evacuated using low vacuum and flushed with nitrogen. Hydrogen gas was then bubbled through the suspension until the reaction was complete by TLC. The suspension was filtered through Celite ${ }^{\square}$ using $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The filtrate was concentrated in vacuo and the resulting residue was passed through a short pad of silica gel furnishing $480 \mathrm{mg}(100 \%)$ of proline derivative 71: colorless oil; $\mathrm{R}_{\mathrm{f}}=0.22$ (silica gel, $\left.\mathrm{Et}_{2} \mathrm{O}\right) ;[\square]_{\mathrm{D}}=-9.3\left(\mathrm{c} 1.8, \mathrm{CHCl}_{3}\right) ;$ IR (neat) $\square_{\max } 2952,1730,1462,1253,1197,1095,1004,834,774,625,459,448,418 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \square 3.72(\mathrm{~s}, 3 \mathrm{H}), 3.58(\mathrm{~m}, 2 \mathrm{H}), 2.96(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}) 2.34\left(\mathrm{bs}, 1 \mathrm{H}, \mathrm{D}_{2} \mathrm{O}\right.$ exchangeable), $2.15(\mathrm{~m}, 1 \mathrm{H}), 1.82-1.31(\mathrm{~m}, 7 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.03(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \square 176.9,69.5,63.0,52.3,46.3,35.9,35.8,28.6,25.9,24.7,18.3$ (3C), 5.3 (2 C). Proline derivative 70. The same procedures used to obtain proline 69 including hydroboration were used starting from ( $S$ )-2-allylproline
hydrochloride. The alcohol was not protected as its TBS ether. Instead, the resulting alcohol ( $0.98 \mathrm{~g}, 3.05 \mathrm{mmol}$ ) from hydroboration was dissolved in $\mathrm{MeCN}(22.5 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(7.5 \mathrm{~mL})$ (3:1, 0.1 $M$ ). To the stirring solution was added $\mathrm{PhI}(\mathrm{OAc})_{2}(2.16 \mathrm{~g}, 6.71 \mathrm{mmol}, 2.2$ equiv $)$ followed by 2,2,6,6-tetramethyl-1-piperidinyloxy free radical (TEMPO, $95.3 \mathrm{mg}, 0.61 \mathrm{mmol}, 0.2$ equiv) and the reaction was stirred for 5 h . The reaction mixture was then poured into a separatory funnel and diluted with EtOAc (200 mL) and quenched with $1 M$ aqueous HCl (100 mL ). The layers were separated and the aqueous layer was back extracted with EtOAc (2 $\square 50$ mL ). The organic layers were combined and washed with saturated aqueous NaCl , dried over anhydrous $\mathrm{MgSO}_{4}$ and concentrated in vacuo. The crude oil was dissolved in EtOAc ( 50 mL ) and treated with ethereal $\mathrm{CH}_{2} \mathrm{~N}_{2}$. The esterification was monitored by TLC and when deemed complete, the excess diazomethane was quenched with glacial acetic acid and the reaction was once again concentrated in vacuo. The crude oil was purified by flash column chromatography (silica gel, $1: 5 \square 1: 3$ EtOAc:hexanes) to give $0.92 \mathrm{~g}(86 \%)$ of 70 .

Amide 72. The resultant suspension was allowed to stir vigorously for 1 min after which $i-\operatorname{Pr}_{2} \operatorname{EtN}$ (freshly distilled from $\mathrm{CaH}_{2}, 0.298 \mathrm{~mL}, 1.71 \mathrm{mmol}, 1.1$ equiv) was injected rapidly in one portion. After 5 min the cooling bath was removed, and the reaction was allowed to warm to ambient temperature. The reaction was allowed to run for 10 h at room temperature before being diluted with EtOAc (10 $\mathrm{mL})$ and quenched with 1 M aqueous $\mathrm{HCl}(20 \mathrm{~mL})$. The reaction mixture was poured into a
separatory funnel and the layers were separated. The aqueous layer was extracted with additional EtOAc ( 20 mL ). The organic portions were combined, washed with saturated aqueous $\mathrm{NaCl}(20 \mathrm{~mL})$, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The residue was purified by flash column chromatography (silica gel; 2:1 $\mathrm{Et}_{2} \mathrm{O}$ :hexanes) to furnish 72 (678 mg of the lower diastereomer and 102 mg of the upper diastereomer, $62 \%$ ). The solution was concentrated in vacuo and the residue was purified by flash column chromatography (silica gel, $1: 1$ [ 2:1 EtOAc:hexanes) furnishing $88 \mathrm{mg}(69 \%)$ of diketopiperazine 75.

Diketopiperazine 75 (via 53). Proline derivative 70 (1.62 g, 4.65 mmol ) was dissolved in $\mathrm{MeOH}: E t O A c(1: 1,46.6 \mathrm{~mL}, 0.1$ M). $10 \% \mathrm{Pd} / \mathrm{C}(324 \mathrm{mg}, 20 \% \mathrm{w} / \mathrm{w})$ was added and hydrogen was bubbled through the vigorously stirring solution. After 30 min the reaction was complete and was filtered through Celite ${ }^{\circledR}$ and concentrated to a clear, yellow oil. (Note: The resulting amine could be isolated but required storage at $-7{ }^{\circ} \mathrm{C}$ to prevent lactamization.) This oil was
immediately combined with tryptophan acid 52 ( $2.42 \mathrm{~g}, 4.65 \mathrm{mmol}, 1$ equiv) and this mixture was dried azeotropically using benzene ( 20 mL ). Once dry, the mixture was dissolved in DMF (93 mL) and $O-\left(7\right.$-azabenzotriazol-1-yl) $-N, N, N^{\prime}, N^{\prime}$-tetramethyluromoium hexafluorophosphate (HATU, $1.95 \mathrm{~g}, 5.12 \mathrm{mmol}, 1.1$ equiv) was added followed by the dropwise addition of $i-\operatorname{Pr}_{2} \mathrm{EtN}$ (freshly distilled over $\mathrm{CaH}_{2}, 2.44 \mathrm{~mL}, 14.0 \mathrm{mmol}, 3.0$ equiv). The reaction was stirred for 12 h after which it was diluted with EtOAc $(500 \mathrm{~mL})$ and quenched with $1 M$ aqueous $\mathrm{HCl}(1.5 \mathrm{~L})$. The layers were separated and the aqueous layer was back extracted with EtOAc ( 100 mL ). Organics were combined and washed with saturated aqueous $\mathrm{NaCl}(2 \square 1$ L), dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The resulting crude material was purified by flash column chromatography (silica gel, 1:5 — 1:1 EtOAc:hexanes) furnishing $2.71 \mathrm{~g}(81 \%)$ of amide 73. Amide $73(100 \mathrm{mg}, 0.139 \mathrm{mmol})$ was dried azeotropically from benzene $(10 \mathrm{~mL})$ and dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(14 \mathrm{~mL}, 0.01 \mathrm{M}) . \mathrm{Et}_{3} \mathrm{SiH}\left(0.89 \mathrm{~mL}, 5.57 \mathrm{mmol}, 40\right.$ equiv) and $\mathrm{Et}_{3} \mathrm{~N}(0.039$ $\mathrm{mL}, 0.279 \mathrm{mmol}$, 2 equiv) were added to the stirring solution followed by $\mathrm{Pd}_{2} \mathrm{dba}_{3} \cdot \mathrm{CHCl}_{3}(29$ $\mathrm{mg}, 27.8 \mathrm{mmol}, 0.2$ equiv). The reaction was stirred for 2.5 h at which point all of the starting material amide had been consumed. The reaction was passed through two successive $\mathrm{MgSO}_{4}{ }^{-}$ Celite ${ }^{\circledR}$ pads eluting with $\mathrm{MeOH}(100 \mathrm{~mL})$ then $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{~mL})$ to remove the palladium. The filtrate was heated at $60^{\circ} \mathrm{C}$ and the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was boiled off using a Dean-Stark trap. After 30 min, DMF ( 50 mL ) was added to the MeOH solution and the heating was increased to $110{ }^{\circ} \mathrm{C}$. The MeOH was also removed using the Dean-Stark trap. The reaction was complete after 2.5 h as indicated by TLC and was concentrated in vacuo. The crude reaction material was purified by column chromatography (silica gel, $1: 1 \square \mathrm{EtOAc}$ ) furnishing $1.08 \mathrm{~g}(80 \%)$ of the unprotected diketopiperazines. Stephacidin A (1). Olefin 6 ( $5 \mathrm{mg}, 0.0094 \mathrm{mmol}$ ) was transferred to a new round bottom flask. Any solvent was removed first by exposure to a stream of dry nitrogen followed by exposure to high vacuum. The reaction vessel was sealed and attached to a source of dry nitrogen. The reaction vessel was immersed in an oil bath preheated to $200^{\circ} \mathrm{C}$ and removed after 1 h of heating. Once at room temperature, the residue was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and purified by PTLC (silica gel; 4:1 EtOAc:hexanes) furnishing $1.8 \mathrm{mg}(45 \%)$ of stephacidin A (1) along with recovered $N$-Boc deprotected olefin ( 0.4 mg ). Synthetic stephacidin A displayed identical spectroscopic properties to that reported for natural stephacidin A ( ${ }^{1} \mathrm{H}$ NMR in two solvents, ${ }^{1} \mathrm{H}-\mathrm{H}$ COESY, HRMS; DMSO- $d_{6}$ spectra attached).

Procedure for entry 7: Compound $\mathbf{5 0}(5.5 \mathrm{mg}, 0.0103 \mathrm{mmol})$ was dissolved in THF: 1 M aqueous $\mathrm{HCl}(3: 1,3 \mathrm{~mL}: 1 \mathrm{~mL}, 2.58 \mathrm{mM})$ and the reaction vessel was sealed. The reaction mixture was immersed in a preheated $100^{\circ} \mathrm{C}$ oil bath for 24 hr . The solvent was removed in vacuo and the residue was purified by preparatory TLC (3:1:0.1, EtOAc:hexanes:MeOH) providing 1 ( 0.9 mg , 20\%) along with $N$-Boc-deprotected 50 ( $0.5 \mathrm{mg}, 11 \%$ ).

Model diketopiperazine 83. A mixture of racemic 53 ( $122 \mathrm{mg}, 0.567$ mmol, 1 equiv) and $\mathbf{8 1}(273 \mathrm{mg}, 0.623 \mathrm{mmol}, 1.1$ equiv) was dried azeotropically using benzene ( 5 mL ). Once dry, the mixture was dissolved in DMF ( 6.23 mL , $0.1 M$ ) and $O-(7-$ azabenzotriazol-1-y 1$)-N, \quad N, \quad N^{\prime}, \quad N^{\prime}$ 'tetramethyluromoium hexafluorophosphate (HATU, $237 \mathrm{mg}, 0.623 \mathrm{mmol}, 1.1$ equiv) followed by $i-\operatorname{Pr}_{2} \operatorname{EtN}(0.296 \mathrm{~mL}$,
$1.70 \mathrm{mmol}, 3.0$ equiv). The mixture was allowed to react for approximately 12 h . The reaction vessel contents were then poured into separatory funnel and diluted with $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$ and $1 M$ aqueous $\mathrm{HCl}(30 \mathrm{~mL})$. The layers were separated and the aqueous portion was extracted a second time with additional $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{~mL})$. The organic portions were combined, washed with saturated aqueous NaCl , dried over $\mathrm{MgSO}_{4}$, concentrated and purified by column chromatography (silica gel, 5:2 प 2:1 〕 3:2 hexanes:EtOAc) furnishing $266 \mathrm{mg}(74 \%)$ of $\mathbf{8 2}$ as an inseparable mixture of diastereomers. To a solution of $\mathbf{8 2}(4.793 \mathrm{~g}, 7.54 \mathrm{mmol})$ prepared as above in toluene ( 66 mL ) was added $10 \% \mathrm{Pd} / \mathrm{C}(25 \% \mathrm{w} / \mathrm{w})$. The suspension was stirred vigorously while hydrogen gas was bubbled through using a 20 gauge needle. After all starting material had been consumed (approximately 10 h ), the reaction mixture was passed through a Celite ${ }^{\square}$. The filter cake was washed with additional toluene (approximately 20 mL ). The filtrate was then heated at reflux for 2 h then evaporated and the residue was purified by column chromatography (silica gel, $3: 2 \square 1: 2 \square 1: 3 \square 1: 4 \square$ hexanes:EtOAc then EtOAc) furnishing 1.512 g of the upper diastereomer of the unprotected diketopiperazine and 1.580 g of the lower diasteomer (3.092 g total, 87\%). Avrainvillamide (3). CAUTION: The following procedure should be conducted in a well-ventilated fume hood as hydrogen cyanide gas is evolved upon addition of the reducing agent to the reaction mixture. To a solution of stephacidin $\mathrm{A}(\mathbf{1}, 3.5 \mathrm{mg}, 0.0081 \mathrm{mmol})$ in $\mathrm{AcOH}(0.650 \mathrm{~mL}, 0.0125 \mathrm{M})$ was added $\mathrm{NaBH}_{3} \mathrm{CN}(20.4 \mathrm{mg}, 0.325 \mathrm{mmol})$ in one portion. The reaction was allowed to stir for 16 h after which it was quenched by pouring it into saturated aqueous $\mathrm{NaHCO}_{3}(6 \mathrm{~mL})$. The mixture was diluted with EtOAc $(5 \mathrm{~mL})$ and $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$ and poured into a separatory funnel. The layers were separated, and the aqueous portion was back-extracted with EtOAc ( 10 mL ). The combined organic portions were washed with saturated aqueous NaCl , dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The conversion was $>95 \%$ as judged by ${ }^{1} \mathrm{H}$ NMR (inconsequential mixture of diastereomers). To a solution of the indoline ( $4 \mathrm{mg}, 0.0092 \mathrm{mmol}$ )
in 1,4-dioxane ( $0.461 \mathrm{~mL}, 0.02 \mathrm{M}$ ) was added $35 \%$ aqueous $\mathrm{H}_{2} \mathrm{O}_{2}(0.0118 \mathrm{~mL})$ followed by $\mathrm{SeO}_{2}$ ( $0.26 \mathrm{mg} ; 0.0102 \mathrm{~mL}$ from a solution in water made by dissolving $10 \mathrm{mg} \mathrm{SeO}_{2}$ in $0.4 \mathrm{~mL} \mathrm{H}_{2} \mathrm{O}$ ). The reaction was allowed to stir for 40 h after which the solution was diluted with $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$ and EtOAc ( 3 mL ). The layers were separated in a separatory funnel and the aqueous portion was back-extracted with EtOAc ( 3 mL ). The combined organic portions were washed with saturated aqueous $\mathrm{NaCl}(5 \mathrm{~mL})$, dried over anhydrous $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The residue was purified by PTLC $\left(\mathrm{SiO}_{2}, 100 \% \mathrm{EtOAc}\right)$ and furnished starting material indoline (2.0 $\mathrm{mg}, 50 \%$ ) and avrainvillamide ( $\mathbf{3}, 1.1 \mathrm{mg}, 27 \%$ yield) as a bright yellow amorphous solid. Synthetic $\mathbf{3}$ was identical to natural $\mathbf{3}$ as judged by LCMS, TLC in several solvent mixtures, ${ }^{1} \mathrm{H}$ NMR, and optical rotation (synthetic $\mathbf{3}[\square]_{D}=+11\left(c 0.1, \mathrm{CHCl}_{3}\right)$; natural $\mathbf{3}[\mathrm{C}]_{\mathrm{D}}=10.6(\mathrm{c} 0.17$, $\mathrm{CHCl}_{3}$ ).

Stephacidin B (2). Procedure A: ${ }^{[6]}$ To a solution of avrainvillamide (3, $0.5 \mathrm{mg}, 0.0011 \mathrm{mmol})$ in $\mathrm{CH}_{3} \mathrm{CN}(0.085 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}(0.015 \mathrm{~mL})$. The reaction was allowed to stir at room temperature for 45 min . The resulting solution was evaporated and dried under high vacuum for 30 min . The residue was purified by PTLC $\left(\mathrm{SiO}_{2}\right.$, $100 \% \mathrm{EtOAc}$ ). Procedure B: avrainvillamide (3) was absorbed onto a prep plate and allowed to stand for 1 h before being eluted. Stephacidin B could be separated from avrainvillamide by eluting solvent twice during purification. This procedure gave a $15-20 \%$ yield of 2 along with recovered 3 (70-80\%). Procedure C: avrainvillamide was dissolved in DMSO and then the solvent was removed in vacuo over 30 min to $1 \mathrm{~h} .{ }^{1} \mathrm{H}$ NMR indicated a ratio of 2:1 (3:2)
(avrainvillamide:stephacidin B) which could be separated by PTLC. Synthetic 2 was identical in all respects to a sample of natural 2 kindly provided by BMS (LCMS, TLC in several solvent mixtures, ${ }^{1} \mathrm{H}$ NMR, and optical rotation (synthetic (-)-2: $[\square]_{\mathrm{D}}=-33\left(\mathrm{c} 0.1, \mathrm{CH}_{3} \mathrm{CN}\right)$; natural (-)2: $[\square]_{\mathrm{D}}=-21.1\left(\mathrm{c} 0.19, \mathrm{CDCl}_{3}\right)$.

To the yellow solution was added $\mathrm{Et}_{3} \mathrm{~N}(0.183 \mathrm{~mL}, 1.3 \mathrm{mmol}, 100$ equiv). After 15 min , the reaction color had become clear brown and after 1 h , TLC indicated that all starting material had been consumed. The solvent was removed in vacuo. The residue was purified by PTLC ( $3 \square 0.5$ mm thick plates, 2:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :acetone) to yield $32.5 \mathrm{mg}(69 \%)$ of $\mathbf{9 5}$ : yellow-white powder; $\mathrm{R}_{\mathrm{f}}=$ 0.24 (silica gel, 2:1 $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ :acetone); IR (neat) $\square_{\max } 2360,2341,1683,1558,1540,1507,1457$, 1395, $668 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.600 \mathrm{MHz}, \mathrm{DMSO}_{-} \mathrm{d}_{6}\right) \square 10.84(\mathrm{~s}, 1 \mathrm{H}), 7.93(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.61$ $(\mathrm{s}, 1 \mathrm{H}), 7.21(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.10(\mathrm{t}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.00(\mathrm{t}, J=$ $7.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.89(\mathrm{t}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 5.37(\mathrm{~s}, 1 \mathrm{H}), 5.01(\mathrm{~s}, 1 \mathrm{H}), 4.55(\mathrm{~s}, 1 \mathrm{H}), 3.48-3.43(\mathrm{~m}$, $1 \mathrm{H}), 3.42-3.38(\mathrm{~m}, 1 \mathrm{H}), 3.30-3.25(\mathrm{~m}, 2 \mathrm{H}), 3.21-3.14(\mathrm{~m}, 1 \mathrm{H}), 2.82(\mathrm{~d}, J=9.6 \mathrm{~Hz}, 1 \mathrm{H})$, $2.71-2.60(\mathrm{~m}, 2 \mathrm{H}), 2.49-2.43(\mathrm{~m}, 1 \mathrm{H}), 2.32(\mathrm{~d}, J=14.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.20-2.13(\mathrm{~m}, 1 \mathrm{H}), 2.12$ (s, 1 H$), 2.11-2.02(\mathrm{~m}, 2 \mathrm{H}), 2.01-1.94(\mathrm{~m}, 1 \mathrm{H}), 1.93-1.78(\mathrm{~m}, 3 \mathrm{H}), 1.74(\mathrm{~s}, 3 \mathrm{H}), 1.59(\mathrm{~s}, 3$ H), $1.40(\mathrm{~s}, 3 \mathrm{H}), 1.04(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 150 MHz , DMSO- $d_{6}$ ) $\square$; HRMS (ESI-TOF) calculated for $\mathrm{C}_{42} \mathrm{H}_{42} \mathrm{~N}_{6} \mathrm{O}_{6}\left[M+\mathrm{H}^{+}\right]$: 727.3244; found 727.3264.
