1. Tuning Parameters for the Q-tof-2

The instrument was scanned from 50 Daltons to 1020 Daltons in 2 seconds, with a 123 S pusher time. W-mode was used in the +ESI mode with a resolution of about 17500 (peak width at half-height). The source was heated at 80 degrees and the electrospray probe temperature was set at 150 degrees. The cone voltage was 35 V. The argon pressure in the collision cell was optimized for maximum resolution. The settings below were used to optimize sensitivity for small molecules.

MS profile:

Mass	Dwell Time	Ramp Time
45	10	80
400	10	0
400		

Rf settings:

	Gain	Offset
Transport Rf	3	0.2
Collision Rf	3	0.2

Calibration:

Calibration Solution: 40 mg of sodium acetate trihydrate (Sigma) and 2 mg of acetamide were dissolved in 5 mL of Mobile Phase A (5% methanol, 95% water, 12.5 mM ammonium acetate, 12.5 mM acetic acid). After vortexing to dissolve the compounds, 5 mL of Mobile Phase B (95% methanol, 5% water, 12.5 mM ammonium acetate, 12.5 mM acetic acid) was added. This solution was subsequently diluted 1:10 with additional Mobile Phase B.

4 L of Calibration Solution was injected into the Q-tof-2. A third order calibration curve was obtained using the MassLynx 3.51 software. The calibration accuracy was verified using a second injection of 4 L of Calibration Solution. [The masses of the sodium acetate clusters used for calibration were not corrected for the mass of the missing electron, and the calibration curve was thus shifted by the mass of one electron; the calculated masses from MassLynx 3.5 likewise are shifted by one electron.]

Accurate Mass Product Ion Spectra:

Compounds were injected into the mass spectrometer and the spectra were recorded. The collision gas pressure was optimized for resolution. The cone energy was set at 35V for all work. Product ion spectra were obtained for most compounds using alternating scans at three different collision energies: 20 V, 25V, and 30V. Some of the experimental details are summarized in Table 2.

Absolute intensities were kept below 150 counts/second, so no corrections (N_p) were made for multiple ions hitting the detector at the same time. To maximize accuracy, all parameters used for obtaining data were identical to the parameters used in calibrating the Q-tof-2, except for collision energy. For example, cone voltage, scan time, and scan range were kept constant.

2. Conditions used to obtain the spectra.

Compound	Conc.	•L inj	Quattro II	Cone voltage ^c	Coll. Energy Quattro II	mcL _{inj} Q-tof-2	Q-tof-2 Functions 1, 2, and 3
xemilofiban	25ng/uL	10	Quattro II	70	20	10	20

Works for none: fragments 17 to 23;

W only: fragments 3, 6, and 7; Y only: fragment 5;

X only: fragments 9,11,25, and 27;

X and Y: fragments 10,13,26, and 29

4. Cells as sums/differences of neutralized fragment ions

5-cell 6 hits can require up to 4 sums/differences to define a cell.

ion 1:	A	B	C	D	E
ion 2:					E
ion 3:				D	E
ion 4:		A			
ion 5:		B	C		
ion 6:		C	D		

B can be calculated in two ways, both require a sum/difference of 4 ions:

$$B = (B+C) + (D+E) - (C+D) - E = \text{ion 5} + \text{ion 3} - \text{ion 6} - \text{ion 2}$$

$$B = ((A+B+C+D+E) - (C+D) - E - A) = \text{ion 1} - \text{ion 6} - \text{ion 2} - \text{ion 4}$$

Both formulae require using differences of 4 ions. B is a hidden cell. There is no simpler way to calculate B.

The table below illustrates that with 12 masses (all masses from the spectrum of xemilofiban) it is possible to generate every positive integer between 1 and 358, the molecular weight of xemilofiban, using sums/differences of 1,2,3, or 4 ions. In the table below, 1 means add the following integer, - means subtract the following integer, and 0 means ignore the following integer.

5. Compound B: Inputting Different molecular formulae/ Isotope Ratios

Section A: MaxDefect of Cells was about 2.5 milliDaltons

Elemental Composition Used: C28H34N2O13S1Cl0F0

MaxDefect 25

Solution Number 1

Linear Fit 2

Coverage 100

Partitions accounting for less than 6 fragments: 14265615

Number of partitions with required number of fragments: 376051

Number of linked cells rejected: 512

Number of partitions failing least squares criterion: 2571

Number of partitions not matching any model: 113

Number of partitions with contradictory CID-MSMS data: 21

Number of partitions failing MinimumCoverage test: 374327

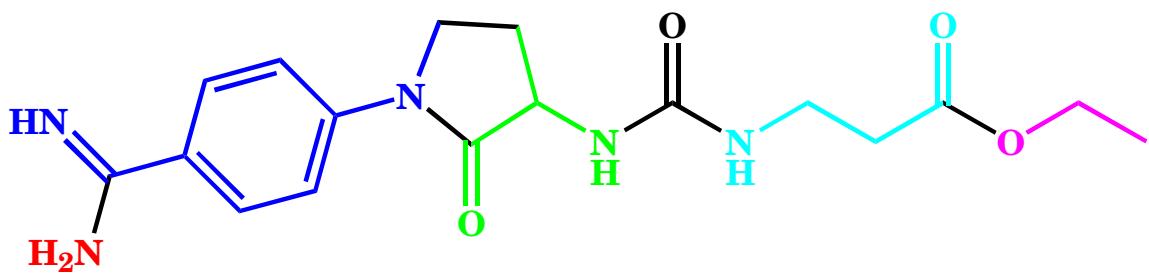

Number of partitions not fitting the elemental data: 6

Number of partitions duplicated by multisign: 1505

Number of partitions having multiple elemental compositions: 0

12. Orbofiban

The structure of orbofiban is shown above its hypothetical 6-cell modular structure. The data was analyzed using the 5-cell program.
